Program in an old fashioned favourite.
- *Hide-It* 94  
Protect your Basic programmes.

# DATA STATEMENTS

## Electronic Arts in the UK

Electronic Arts, one of the top US entertainment software companies have announced their plans to launch a UK subsidiary, and are looking for new talent. 'We are looking to support UK software artists designing high quality software' comments Mark Lewis, Director of European publishing. 'We are interested in jobs a number of software developers and we are happy to talk to those who believe they can offer creative and quality programming.'

### Facilities

Electronic Arts Ltd, London Business Centre, 17-19 Station Road, London W1, Albany Building SE1 8JN. Tel: 071 23447.

## What Book to Buy

Following the success of the "What's New" range of computer books, H & D Services have decided to go ahead with their second volume. A major feature in the marketing of the book is that they will be sold only through independent retailers. This provides a natural link with United Software Distribution Ltd (U.S.D.) who will be processing the book to major independent computer retailers in the UK.

U.S.D.'s Managing Director Andy Wood commented, 'These publications help the consumers gain more understanding of the software that they buy. The books also pointing the longevity of software and they help

solve some of the queries that inexperienced retailers and software houses alike.'

The "What" range are available only from computer retailers and include "What's New" which is a handbook for advertisers packed with hints, traps and solutions. Also "What's Hot" which compares hints, traps and prices for arcade type games.

### Facilities

H & D Services Ltd, Station Old Road, Maple Green, Manchester M21 6LQ. Tel: 061-270 9888.

## Shades for "Free"

All BMSnet members are now eligible for free hours free play on shades - the multi-way adventure game Shades (a Shades player has to be licensed) can use their free hours anyway they want - in one block of ten hours for one person or spread out in smaller blocks. The offer stands for all BMSnet members regardless of whether they've played before or not.

### Facilities

Microsoft Fringing Ltd, Darwin House, 8 Alfred Rd, London EC1R 4JF. Tel: 07-278 3343.

## Computer MIDI in Action at Shows

One of the big crowd pullers at the forthcoming PCW show will probably be Electronic Research (EMR) with their Inc computer-controlled music demonstration. EMR's range of computer MIDI software and hardware covers most home and business 1/16/32-bit systems and now recording, sampling and score writing products will be on display. The special offers will include an EMR

recording system which controls MIDI keyboard and computer for DOS.

So follow the sound of music, and you're assured of an entertaining time, not to mention the odd bargain or two.

### Facilities

Electronic Research (EMR) Ltd, 14 Mount Eden, Wokingham, Surrey RG40 5AG. Tel: 0752 335347.

## New Labels

Get in a new high profile and performance software brand from U.S. Gold which claims to release six major software products between now and December. Although the products will be sold into certain sales, marketing and distribution channels of U.S. Gold, they will appear on the market as a separate company in terms of advertising schemes and European distributors.

## D A T A S T A T E M E N T S

Go! hope to link up with Capcom America of Miami, Canada and Laser Tag from World of Wonder, the best selling toy store. Unconquered Warrior production is the home computer version of the blockbuster Mission of the Impossible film.

U.S. Gold's Tom Clavary refers to the success of Go! and comments 'we are very confident that three years experience as brand leaders in the European software marketplace puts us in the pole position to successfully launch a new brand.'

Following the success of Software Palace have now launched a new software label - Outlaw Productions. Matthew Trent, previously general manager of Palace Software, will head the new operation, which will run alongside Palace. Matthew comments 'there are now a number of highly skilled and professional developers teams in existence. Our aim is to help them produce their best work and to market it using the skills and knowledge we have picked up over the last three years.'

The first release on the new label will be a Show 'em Up Commodore Am

From left: Joannee Stone, Stephen Day and Christopher Yates.

for the C64. It has been developed by Joannee Stone and Christopher Yates of Scenic Software, who with their understanding of the C64 have developed a system, which will enable a person with no programming knowledge to write the text of games that would have cost £300.

#### Features

Go! Ltd, Fax: 01-262-0111, 140/141 High Street, London EC2A 4JH. Tel: 01-262-3188.

Palace Software Ltd, 174, Pentonville Road, London N1 9NF. Tel: 01-262-3971.

### Amiga Action

Alkemie Software, have released 4th instalment of a game for the C64 priced at £19.95 on disk. An additional game of shooting, strategy, protecting, planning and humour which demands some sharp reflexes.

Conquer is in the final stages of completing Conquer Capow which will feature the formidable Jack the Napper. The game is set in the jungle where the tranquillity is broken by the arrival of Jack, who jumps from a plane using his jetpack as a parachute.

His later however is a hot pursuit and Jack being Jack, goes on to combat with a tropical Crocod in his

efforts to avoid being caught and given a spanking. Jack discovers the crocods are a useful form of defence against the natives and tries to train them to be as naughty as possible. A special surprise awaits Jack as he reaches 100% on the Napper counter, but only playing the game will reveal it!

Conquer Capow will be available for £14.99 on disk for the Commodore.

Set in the latest 'Corgi of Ford' game from Virgin. You play worker THX 226, forced to work in an egghead factory of the future. However, you can take as much and steal a truck from the Crowd Control Vehicle armory. Then you must escape by diverting the tank energy normally used to enhance crop growth. You need to collect and arrange solar reflexes to reflect the beam and blast your way through the traps and make your final escape. Corgi is available on cassette for £64/126 and costs £9.95.

Digital Investigation will be launching their new video cassette F 18 Combat Pilot is a game which

involves using a complex payload of weapons to attack hostile and destroy targets. Complete history of modern weapons including AIM-96 Sidewinder and AMRAAM cruise, AGM Maverick laser guided bombs and Titan cruise to cruise and war.

The 477 advanced tactical fighter's powerful low-flying and virtually undetectable Lockheed YF-23A. For an authoritative information about a variety of topics and the way they will develop in a future world.

With detailed charts, user equipment and back-up support.

### Hardware Update

Now is the time for registered Commodore users to buy a colour monitor for their Amiga Commodore Business Machines (UK) Ltd are offering £180 off either the Amiga 500 or A1664 colour monitor and £200 off the pair through retailers which have been awarded all registered Commodore users. Commodore dealers have also been notified and a window sticker will appear their participation. There's no time to waste - the offer closes on September 12th.

An upgraded version of the Executable disk drive is now available for the C64 from Everton Motors, who believe it is now the most compatible drive on the market. It is selling for £129 and following wide production difficulties it is now fully available from the foreign manufacturers.

The effects of exposure to noise in a computered environment are often underestimated and printers in particular should be continuously checked to ensure sound levels. Keweenaw have recently produced a Soundshield which is fixed to the dot matrix or compact display sheet printer, which will reduce noise levels by 15 decibels. The unit is fixed with Sea treatment foam and features a tested reinforced glass lid. The price ranges from £99.90 to £109.90, with additional options available such as a dust filter attachment and stand and a plug-in kit.

In addition to the Amiga 500 C125 and C64, Commodore's distributors

The upgraded Executable disk drive

have now been given control over the PC16, PC28 and PC48/720. The distributors are Tomcopter's World in Belfast and Dublin, Lightning Distributors in London High Systems in Bournemouth and ZCL (Zigzag) Holdings in Staffordshire. The new price for complete systems with a colour monitor are £995 for the PC16, £999 for the PC28 and £1299 for the PC 48/720. Tom Hart, Commodore's (UK) national sales manager believes that "the move into the consumer marketplace with these quality engineered products demonstrates a strengthening of the range of Commodore products available to the consumer."

Following successful sales, Star

within computers, of sponsorship funds and get the best listing of goods as you compete on World Cup and Olympic tracks. All games are available for the C64.

Microcom's UK, 113/115, are proud of their two most popular dot matrix printers. The price of the PC-10 which is a one-pass printer offering 12 characters per second (cps) in draft mode and 70 cps in near letter quality has dropped by over ten per cent and is now available for £299 (which includes parallel interface). At the other end of the scale, the NB-12 which provides an incredible 700 cps in draft mode and laser like laser printing at 100 cps, has dropped in price to £249.

In a bid to provide a compact and efficient solution to desktop printing requirements, Vignis have produced a range of printer stands at prices ranging from £9.95 to £29.95. The stands are ideal for use with most 30 or 110 column PC printers and allow for up to 1,000 sheets of continuous stationery to be stored underneath.

## DATA

## Fight to Win

Comrex has released a new game which puts the responsibility of the future of the country in your hands. What a position to be in! In *4 eyes Are Better*, you have been declared and the money is flowing in and your mission is to patrol and defend the coast. You bring all modern weapons systems which include the Starbolt, a deadly accurate missile, the Hunter, a robot-linked rocket and an anti-submarine helicopter. *Comex 4eyes* will be available for the Commodore on disk at \$14.99.

## Features

*Comex Alpha House 10 Commodore Magazine 33 495 Rev 0742 03/87*

## Adventure Time

The MicroProse/Orion partnership has come up with a new concept in fantasy role-playing in *Meridian*. Available on the C64 disk and priced at \$19.95, it comes complete with manual and several handouts.

The aim of the game is to rescue the Princess Cybele from Meridian which has been stolen from Meridian. The game play is set in four different planes - each having different variables and challenging obstacles to overcome. At each level challenges increase. Demanding puzzle solving and crossing out of martial arts, swordsmanship and the use of a

sophisticated missile systems is essential to overcome an array of opponents ranging from ogres to dragons.

Comrex has stepped up the computer software rights to the Charles Brownson film *Death Wish* and it will be busy adapting the film to the small screen to create *Death Wish IV*. Available on the Commodore 64/128, the adventure follows the fortunes of Paul Kersey (Charles Brownson) as the peace-fighter who's out to rid New York of the gangs and crime who infect the streets. Kersey's weapon arsenal include a 471 Wildey Magnum, a pump action shotgun, a machine gun and a rocket launcher. His greatest ally is his belief that the force of justice New York citizens can be found along the strong law behind all the violence and bloodshed in Kersey's *Death Wish*.

*Death Wish Computer*, the latest release from English Software. Follow his adventures through his taxing night routine journey up treacherous roads, down fire channels and lethal roadblocks, quick-fire weapon attacks, dramatic gun-fights across high level bridges and the final great hit and helicopter smash. *Capcom Computer* is available on the Commodore 64/128 at \$9.95 for cassette and \$13.95 on disk.

## The PCW Show is in Town

The Personal Computer World Show is with us once more and after two years it will be the industry's most comprehensive celebration for business. This year's show which is being held at Olympia is being run from Wednesday 8th to Sunday 27th September, and as in previous years the first two days will be reserved for trade and business visitors. The show will open from 10am each day except on Sunday when it will close at 3pm.

Guest suppliers will be located on the business center the car and the business hall at Olympia. Two will have industry reports in addition to some major product and company launches.

Other attractions will include a desktop publishing round (DTP) which will give visitors the chance to see how

copies of the Daily Show News are produced. The editorial staff will also be at hand to offer advice and opinions of the fast growing DTP industry.

The Open Line round will be refreshing with regular video presentations on video systems in health industry and image processing and set to our conversations will be possible between screens.

One of the major events at Olympia at the show will be a chance to win a holiday for two to Thailand. The 14-day holiday which is worth £2,500 can be won by simply creating a disk - to make level two one of your first steps.

Tickets are available at £5 each from the South Province ticket agency, 001-741 9999 or at the door.

# Combat Simulations

*The following games are a selection from the growing band of simulations that pack a punch, and aren't just therapy for retired pilots suffering with an ail symptoms*

*By Tony Hetherington*

**I**f your idea of simulation is pressing 40 keys to lift a plane off the ground, only to circle around for half an hour before its doing, while idly waiting to land, then take a break just as Combat Simulations puts you firmly in the thick of the action. You take control and land often there are piles of war machines with a mission and a mission a night being your and the main strike force before the enemy, train you into a deep mind.

**Infights** maintenance is for those who like their excitement without their feet on the ground and includes bombing runs in World War II, 100 missions for an Apache helicopter, Grounds and Helicopter flights for the SkyFox. Surface missions taken to the high seas and on patrol to a Destroyer sea, finally we plunge into deep trouble and dive (dive) into submarine action.

## Infights: International

Flight simulators were slow to take off with programmes that were difficult to use and were held more than eight years from leaving the player to drive more and more sophisticated ways of working. Flight simulators needed more action. These flight sims have a plenty of action-packed war dogfights and bombing runs and an immersion in the world they simulate.

## B24

In the heart of combat after you take off half of one only one plane but a full squadron of 40 B24s bombing back on the old factories of Ploesti, Romania. Your mission is to knock out the oil supply for Hitler's war machines. The real B24 squadron that was given the task started with 60 aircraft and were left with only four after flying 96 missions. You have only 40 bombers and 14 missions to knock out 11 targets.

With a mission that's tough was a going to need some practice and so two other targets are included and as you train air-you-bomb. Mission in Yugoslavia's base over the

Admiral Sea from your base in Spasskaya, Libya and to land in the old Roman city of Byzantium. Survive these burning missions with your squadron in tact and you're ready for the main event.

To help you plan your first assault the game disk or tape is accompanied by a map of your targets and possible routes, an intelligence report on Ploesti and an intelligence booklet that includes a step by step guide through the Mission in Rome.

The first step of a mission is to take off and circle at about 2000 ft on the other planes that into formation. Then you must rendezvous with your fighter escort, proceed to the target and start your bombing run. There three crews of your run is successful if you're flying at the correct height and speed for your bomb load and release it on the target. Once you're done this you should get out of the area as quickly as possible, and get your squadron back in line with an enemy plane as possible, to and turned for the next mission.

B24 is one of Sid's superb strategy games and despite its crude graphics it's a real gem, great to play. It was designed by two bomber pilots, so it was to be sure of accuracy, and you can spend up to 100 hours to fit past the long flights to and from

the target. The game engages the Squadron Leader. Learn how to fly a plane and hope you reach national stations but plenty to do as you pilot wilderness rivers with fighter escorts, bomb targets and return to base while coping with damage to your own aircraft. One mission down, 11 to go and you've already lost four aircraft and another on need repair!

#### Features:

Title: *RAF Supply US Gold/MSX Dual 2/3* (Wojtek Haj, D. Ford, Birmingham 86 748) Tel: 021 326 3380 *Mechwar* C&M Press, £14.95 (4) £14.95 (6) *Magworks* 2/16 *Graphics* 4/10 *Playability* 1/10 *Faber* 2/10

#### Control

A former Coast of the Month (May 1976) landing took flight simulators to new heights and six players on 100 missions that range from the training field of the USA to the battlefields of the world.

The Apache helicopter gunship is remarkably easy to fly considering there are 11 keyboard and joystick controls thanks to a keyboard overlay and two fly and light their controls.

When you've graduated from the training fields you're ready for your first battle in South East Asia. After an intelligence report and mission details of your primary and secondary targets you load your Apache with a balance of 10mm cannon ammo, Hellfire missiles, Flare rockets and Sidewinder air to air missiles. The exact nature of your weapons is decided by the mission you're on and the ground truth that you're engaging. Cannon fire is good and so is air to air but you'll also need some Flare rockets to take an enemy and give replacements when as Hellfire missiles are needed for armoured targets such as tanks and back-engineering the Sidewinder to great enemy Huey helicopters.

As you travel the globe from Asia to the Middle East, Central America and Europe you'll be challenged by more powerful and better equipped enemies and will need all your skill and cunning to survive. Bares and chills - 60% in the air long enough to complete your mission.

Survival missions will train your senses, instincts and your precision until eventually you'll earn, as a newly decorated Colonel,

Ground is a narrow 100 mission, 70 flight war like is

above the sky is the limit for the pilot skilled in combat flying.

#### Features:

Title: *Acc of Accs* *Supplier* US Gold/MSX 2/3 *Mechwar* C&M Press, £14.95 (4) £14.95 (6) *Magworks* 2/16 *Graphics* 4/10 *Playability* 1/10 *Faber* 2/10

#### Accs of Accs

The Mustang fighter bomber flew a variety of missions during World War II and now it's your turn to take the controls as you try to become the Ace of Aces.

The game begins at the briefing room as the C.O. outlines the tasks ahead to destroy the U-boats as they leave their base, shoot down incoming bombers, defend 7-1 routes and destroy a POW train but not the main objective the program. These missions can be tackled individually but to become the Ace of Aces you will have to tackle them all in a single sortie.

To fly the mission, you will have to master the controls on the screen that show your left and right wings and engines, bomb bay and weapons selected, operations map and forward view from which you must fly the plane and shoot down enemy aircraft.

Acc of Accs owes a lot to an earlier Atari game based on the Distributors list feature: more options, missions and a lot more action.

#### Features:

Title: *Ace of Accs* *Supplier* US Gold (Atari) Dual 2/3 *Wojtek Haj* *Wolford* Birmingham 86 748) Tel: 021 326 3380 *Mechwar* C&M Press, £14.95 (4) £14.95 (6) *Magworks* 2/16 *Graphics* 3/10 *Playability* 4/10 *Faber* 2/10

#### Skills

Wojtek Haj of Accs on 70 covered flight war like on the war front and air war front both an ace mission form of tanks, planes and rocket launchers. The scenarios range from training missions to all out missions that have descriptive names such as the Atomic Mission, Groundlight and Control.

The screen display shows the cockpit of your Mustang Phantom showing the radar scanner to plot the positions of

the intense, slightly faded and speed reductions as well as to cast some of the battle aid. You can punch up a computer screen which will plot your position as well as those of all enemy tanks, planes and warships. Your tactical decisions for the battle—such as when to launch operations, where to destroy your installations, how close and how low to fly—depend on fuel and gears. You can also choose to do the battle on the water at ground level or from a submarine. The final score is displayed with the enemy's input.

**Destiny's Gate** is a game which was one of Amiga.com's picks of 1990. It has been replaced by a new lease of life as *Destiny's Gate* version 1.01.1000.

#### Developer:

**Company:** *Supplied* (Aurora Ave. North Bayshore, Seattle, WA 98148) **Address:** 400 Stevens Road, Langley, BC V3A 9K9, Canada **Tel:** (604) 894-0000 **Modem:** (144) **Availability:** 1/1/90 **Graphics:** 8/15 **Playability:** 1/10 **Value:** 5/10

Here's a class of desktop action at which you must protect the line, avoid time losses, and endeavor to attack in *Commander: Raider* and *Captain* your ship in three different scenarios: mission ranging from a Sabbath to Convoy Escort.

#### Conroy Raider

In *Commander's Conroy, Raider* your mission is to patrol the Island Sea and attack and destroy any enemy planes, ships or aircraft that you find. Finding them isn't a problem as they'll find you even if you don't leave your port. Surviving is the goal.

The action is controlled from the keyboard and mouse. The screen displays the perimeter of any enemy ships on the surface or underwater. If a ship shows up, you must use the appropriate weapons. The weapons are only limited to one level (missile, depth charge, or sonar mine) and you must use the appropriate amount of fuel and gears. You can also choose to do the battle on the water at ground level or from a submarine. The final score is displayed with the enemy's input.

The action is fun and exciting, and it's a good standard of the class.

#### Features:

#### Destiny's Gate

Can you make 13 stations on a Pacific class Destroyer, all in the same day? Can you also use those stations for intelligence, fire, and attack on the high seas? You will need fuel, and more as you take the helm as *Epis's Destroyer*. You'll act as the radar, some navigation, bridge officer, gun deck, forward and aft gun, port and starboard engine room, gun, port and starboard torpedo tubes, depth charge room, and gun control stations. It's on time, between the stations on the ship in one hour, such as BB for bridge and after a few seconds, you're faced with a new set of controls. Most controls are self-explanatory, such as among gears or torpedoes before firing, or setting the depth charge as a bucket of depth for a better chance of taking out a submarine.

In the controlled pace of a full mission, you will need all your skill and strategy to ensure that you get your shot in first, and that it counts even with a hard long battle with a single enemy ship when you've got a cannon to protect and damage control crew to manage, a radar to plot, and so on. An excellent multi-screen simulation.

#### Features:

**Title:** *Destiny's Gate* **Supplier:** *Supplied* (Aurora Ave. North Bayshore, Seattle, WA 98148) **Address:** 400 Stevens Road, Langley, BC V3A 9K9, Canada **Tel:** (604) 894-0000 **Modem:** (144) **Availability:** 1/1/90 **Graphics:** 8/15 **Playability:** 1/10 **Value:** 5/10

The action is controlled from the keyboard and mouse. The screen displays the perimeter of any enemy ships on the surface or underwater. If a ship shows up, you must use the appropriate weapons. The weapons are only limited to one level (missile, depth charge, or sonar mine) and you must use the appropriate amount of fuel and gears. You can also choose to do the battle on the water at ground level or from a submarine. The final score is displayed with the enemy's input.

#### Epis's Destroyer

Epis's Destroyer (Amiga.com) have produced one of the best

uniformity, you'll start likely to plot as you take to the depths of a World War II first class submarine.

The screen display is split into three sections. A strip across the top of the screen shows the command options available and highlights those selected. Below that is the view display, where you can see down either the conning tower or the periscope and below that is an instrument panel showing your bearing, depth, speed, power, torpedoes left and stars or fuel dials or readings, as well as indicators for targets and task items.

If you wish the display to plot your position on the water, it will search for enemy destroyers or perhaps the torpedo data computers to lock on targets then the TD view will swap to a split-screen display with the instrument occupying the right-hand side and the important part of the TD view on the left. The profile works extremely well either in a practice mode or on ground in the Pacific.

The graphics are quite a step on and are the result of Accolade using Strategic 3D routines programmed in its third simulator.

A copy of this game arrived in the Free Commodore office in an unmarked pack, and it took some time to track down where you could get it. There isn't a UK version of it set, and you must be wary of the game disk, instruction book and users manual you'll have to use an imported copy from Strategic Plus Software.

#### Features

Title: *Up Periscope* Supplier: *Strategic Plus Software* Price: *System 2 £12.95 5 Megabyte Models £19.95 Plus £2.50 Post* Machine: *4.44 Price £29.95*

#### Sales Service

Sales Service is on the 12.4 submarine simulation by reach three chosen countries of the UK, Canada.

Once the game has loaded and the screen-released, the program displays the bridge with you standing by the periscope. If you press the button you can see through the conning tower or the view periscope depth but you can also move the joystick to go up to the conning tower to see the deck gun, to the map table to plot a route and to the instruments to change settings. Once released the screen changes to show the relevant display.

As in *Up Periscope*, you can get your submarine skills to the test in a series of scenarios and war patrols in which your targets will be tracked and troop ships and your course the

destroyers. To add to your problems you can include a rotation of reality, which results in poor visibility, increasing complexity, dual torpedoes and the, surprising, eight destroyers.

Sales Service is the cover submarine game to plot, but *Up Periscope* will provide a better campaign game. You may even get promoted.

# Bothersome Basic

*Given up on Basic or never got started? It does have its uses — and it is worth having a second go, so follow this*

SEFMSL

By Eric Doyle

## Essential Attitude

A good attitude to take towards your computer is to think of it as a language with a limited command of English. The first reaction a computerist would expect is, in the normal assumption that they are that aware when phoned and as dumb as a post. In short, even the most subtle a low attack but with a computer nothing could be easier than to find it you don't believe me think of all the times the machine has refused to perform the simplest of tasks without test and control who, so, have to use CAPITAL LETTERS!

Presumably you will all have read the evasive and defensive training given in the Commodore manual and despite this handicap has nevertheless gleaned a few of the very best commands available to you. I will assume that you can now occasionally PRINT messages on the screen and that you will also have learned the fact that programs consist of numbered lines of instructions which the computer slavishly reads and obeys (regrettably). A simple program would look like this:

```
10 PRINT "DON'T PANIC"
```

Type RUN and the words DON'T PANIC appear on the screen. All very comforting but not really useful.

We can get the computer to do something traditionally more fitting by using a detail known as a loop. This causes the program to endlessly repeat the program over and over again. The simplest way to do this is to add the line

```
20 RUN
```

At this time, if I get the program to re-run itself and again and again the comforting message, it will make extreme pains in the program when the worried machine refuses to stop. Don't rush for the power switch simply press the key marked RUN/STOP on the extreme left of the keyboard and the computer will return blank and you type in RUN again.

Believe it or not one of the most common faults at this level of programming is to forget to press the RETURN key when typed at the program. If your computer can't help you properly type LIST (once only) to press RETURN and the contents of the program memory will be revealed.

Now that you're fully equipped with a way to do a computer without up the wall with eternal repeating, still messages, it some local computer store by the way that he will not be impressed with your programming skills! For better to calculate for 30 with

```
10 GOTO 10
```

This will give the computer to loop back and repeat line 10 ad infinitum or until the RUN/STOP key is pressed.

Once again we have produced a program which can help practical application except for its such variable who make the salesman's life a misery of constant vigilance.

## To Usefully Go (To)

Before we get here the GOTO command can be used in a variable way, we have one more kind of loop to consider which introduces a being sought used by all programs, the variable.

**F**ew words have ever been better suited, struggled with and ultimately ignored by countless thousands of world-be programmers. The main problem is that there are very few learning courses specifically aimed at the Commodore of home but I was myself involved with an enterprise aimed at bringing Basic to the masses through intensive weekend courses. One message was that it is not easy to learn from manuals alone and more people require clear concise instructions to help them understand the why and advantages of specific programming problems.

Having just started the lecture to the apparent benefit of the crowd I'd better quickly explain my Basic philosophy!

That notes will describe all aspects of Basic, for the beginner the controller and the present following banker. If you find you don't understand any area then we never during future sessions, pick up your pen and write to me. It is a shame as one of your programs replies in response to gentle persuasion letters from Brian I'd happily assist a flood of what envelopes I will not say that I can't promise to have enough time, as a work to answer all of your individual problems, but I do promise to give all the help I can but only if you follow the instructions at the end of this article.

Each month the article will deal with a simple programming technique followed by a floppy disk with the workings of the computer which may be too advanced for those just starting to write some useful routines, but which will provide the key to a fuller understanding of computers for those who wish to progress to machine code routines later on.

Type **NEW**, press **RETURN** and you will start the computer's command ready for a new program. If you type **LIST** at this point the computer will simply respond with the word **READY** so type the following program in:

```
10 FOR A=1 TO 10
20 PRINT "DON'T PANIC"
30 NEXT A
40 PRINT "FINISHED"
```

Run the program and you will find the phrase printed just ten times, on the screen. To explain this remarkable phenomenon concentrate on line 30.

The letter **A** is known as a variable. The best way to imagine this is to think of the computer as a truck of boxes. We have asked the computer to move one of these boxes containing letter **A** so that it will contain something we say that **A** is equal to. You may now think that we've told the computer that **A** is 1 but what about the **TO 10** bit? This must then show a variable is that it can be varied. We've told the computer that **A** will vary between 1 and 10. The computer translates this as meaning that **A** will have a value of one in the beginning of the program so it stores this value in the box labelled **A**.

The program then runs to line 20 and prints the message. Then when line 30 is translated the computer checks back to where **A** is **TO 10** was encountered and loops back to that line. Now the clever part begins. Checking the contents of box **A**, the computer finds that it still contains a one. Having been told that **A** will vary between 1 and 10 it increments the contents of the box by one so that **A** now contains the value two. Line 20 is obeyed and **NEXT A** is encountered so once it loops back to line 10. Once near the content of box **A** is incremented by one to three and the whole process is repeated until **A** has a value of ten.

When **A** is incremented the computer checks to see if that number is greater than ten. We have now reached the point where **A** is 10 and is incremented so eleven this is higher than ten and so the program jumps to the line after the **NEXT A** statement and **FINISHED** is printed on the screen.

How can we prove that this happens? First of all type **PRINT A** and press **RETURN**. The value which is printed on the screen. Hence it seems plausible but we need proof.

### Semi-Differences

Let's try something different. **LIST 20**, move the cursor to the end of line 30 and type in a semi-colon. Press **RETURN** and **LIST** the program. Naturally the computer should have inserted the altered line in its correct place in the program.

```
10 FOR A=1 TO 10
20 PRINT "DON'T PANIC"
30 NEXT A
40PRINT "FINISHED"
```

Change line 40 to read **PRINT A**, and run the program. This time the message is printed ten times across the screen with 11 printed at the end. The semi-colon tells the computer that the next **PRINT** statement will continue from where the last print statement has left off. Alter line 40 to:

### #PRINTA PRINT 'FINISHED'

Run this and you'll see that the number 11 is now printed on a separate line. We have added the semi-colon decimal sign. As you can see more than one statement can be written on a program line so long as you separate the commands by a colon. **NEW** the program and type this in:

```
10 FOR A=1 TO 10 PRINT A
DON'T PANIC' NEXT A 'A
```

Don't worry about the apostrophe mark on line 10 just type in the line as printed here and run the new program.

This time the messages are preceded by a number which is the current value of **A**. List the program and you'll find that the question mark has changed to the word **PRINT**. The computer has a built-in shorthand

Command	Abbreviation		
ABS	ab	NEXT	ne
AND	an	NOT	no
ASC	as	ON	on
ATN	at	OPEN	op
CHR%	ch	OR	or
CLOSE	cd	PEEK	pe
CLR	cl	POKE	po
CMD	cm	POS	pos
CONT	cd	PRINT	p
COS	co	PRINT#	pn
DAT#	da	READ	re
DEF	de	REM	re
DIM	dj	RESTORE	res
END	en	RETURN	ret
EXP	ex	RIGHT#	ri
FN	fn	RND	rn
FOR	fo	RUN	ru
FREE	fr	SAVE	sa
GET	ge	SCREEN	sg
GET#	get#	SIN	si
GOSUB	gos	SPEC	sp
GOTO	go	SGR	so
IF	if	STOP	st
INPUT	input	STOP	st
INPUT#	in	STR#	str
INT	int	STR	st
LEFT#	lef	STR	st
LEN	len	TAB	ta
LET	le	TAN	ta
LIST	li	THEN	th
LOAD	lo	USR	ur
LOAD#	lop	VAL	va
LOAD#	lo	VERIFY	ve
NEW	new	WRITE	wr

which are next upper and lower. You may have remembered last year which base keys that the computer refuses to accept because they weren't found two lines or more on the screen. This is known as the logical line length which, typically, is the maximum length of a line and equals 90 characters or in other words two screen lines.

We'll come back to this later to show it in the back of your mind as a box marked "Don't Forget".

### Nine Times?

Let's put our loop to some serious work. A computer is most often a sophisticated adding machine but it can be used to do almost all the calculations. Let's convert a program which produces the nine times table. We could do this in the long handed way which would repeat lines such as

```
PRINT 2 * 9 = " 18"
20 3 * 9 = " 27"
and so on but using a loop simplifies all the typing:
10 FOR A=1 TO 12
20 A * 9 = " A9"
30 NEXT A
```

You'll notice that I've failed to type A after NEXT in line 30 preferring to let the computer decide which variable we're currently using. This variable's name is not particularly helpful when you come back to look at the listing in the next issue so why not use the computer's ability to understand longer variable names. It could easily be called NUMBER instead of A but you must change the name in each line where it appears.

We've now two loops in the same line by placing our words in the order

```
10 FOR MULTIPLIER=2 TO 12
20 FOR NUMBER=3 TO 12
30 NUMBER * MULTIPLIER
= NUMBER * MULTIPLIER
40 NEXT NUMBER
```

Running the program causes the computer to put up the full set of tables from two to 12 but all goes too quickly for any practical purpose.

You'll also notice that I only used the first two letters of each variable name in the NEXT statements. The name of a variable is a bit of a cost because the computer only

labels the relevant lines with the first two letters of the variable's name. When naming variables you must always remember this because the computer would treat variables called MULTIPLE-8 and MULTIPLE-AND as the single variable MULT and there would result.

### Loops Within Loops

You'll also have seen that I've gone back to naming the variable after the NEXT statement. When more than one variable is used it's vital to do things that way but make sure that the variables are named in the correct order. The computer will not accept loops which are not properly nested (made one another) in other words the following is acceptable:

```
10 FOR A=1 TO 10
20 FOR B=1 TO 5
```

### DO NEXT BA

But in the following, the loops are not nested loops and would cause problems:

```
10 FOR A=1 TO 10
20 FOR B=1 TO 5
```

### DO NEXT AB

Meanwhile, back to our program there is one way to make it slower to see the times' tables by adding the following line:

```
30 FOR DELAY=1 TO 100 NEXT
30 NEXT B11
```

Now the program pauses in each row while printing. Line 30 simply makes the computer count to 100 before continuing. Try varying the value and see what happens.

### Know Your Shorthand

Below, I pull the plug on the next computer's answer but you'll look at the computer shorthand.

Apart from the question mark for PRINT most of the other key words can be shortened by using the first one or two letters of the keyword followed by the next letter. Instead of the full word to see this in to watch the computer and learn one made by holding down

the Shift key and pressing the Commodore key once.

Type in the following

```
10 %Q=10:GOTO 20
```

Let the program end and you'll find the keyword revealed in full. A full list of abbreviations can be found near the back of your Commodore manual but I included it here to show the number of keyword keywords at your service.

### The Deep End

The following line extends beyond the logical line on the screen. Try entering it as printed here and see what happens when you press RETURN.

```
PRINT "THIS SHOULD NOT
FIT INTO ONE PROGRAM LINE"
FOR A=1 TO 10 FOR B=1000000 A
NEXT B A=2
```

Next search to lower case and enter the line as follows:

```
10 "This would not fit into one
program line" TO=10000000000
B=1:FOR
```

This time the last goes into memory. Line 10 and 11 does the impossible by stretching over three screen lines. Why?

To understand the phenomenon you have to realize that every character in a program line is stored as a pair of numbers in computer's memory locations. Keywords are stored as a word number in memory base line, the 0 and space or PRINT is stored in memory at the value 100 but as a statement such as

```
PRINT "PRINT YOUR NAME"
```

the first PRINT would be stored at a single byte or value 100 but the second PRINT in the question mark would be stored as a string of ASCII codes for the relevant lines. Since 70 and 64 is it was possible to pack a line directly into memory you could literally enter almost 40 lines each on one line!

Send your problems to Eric David Southerton Dept. Two Commodore, 45P East 17th Street, Queens, New York 11375. My address and telephone numbers of during my working hours are in case yours. I'll attend after 5 o'clock and after 9 o'clock on the phone until my retirement. [E]

# Mini Office II

**6** powerful home and business programs in just **ONE** package – at a price that simply can't be matched!

Outstanding value for money ... If you want to use your PC as a highly efficient office assistant, Mini Office certainly gives you the power you need.

— EBT

As a leading manufacturer in desktop computing, the only way we can stay in the price-performance leadership game is to make sure of it. We make sure that our software is the most powerful computer program available in its class.

# Computer Communications

Computer communications are getting to be as fashionable as the moment. But what's really behind the confusion in the noise? We take an in-depth look at what communications are and why they are needed. *By Gregory S. Goldstein*

**W**hat has it and what's not what it should be? In this communication, we compare communications as they are vs. they? They are different because a computer is a machine which cannot think for itself, it's programmable and more importantly, it's not getting the best of a computer when we connect it to a human. A computer and a person are neither on the way that data is

received or sent than the machine will receive and respond to at that time. It's not even the way a letter is sent or even a mail.

It's also not how it's sent than we. We can send anything, it's not a machine which will think, it's only sent by a few computers, perhaps some, delivered to, but it's not a mail, it's not a machine that can receive it.

another within the same building, or a phone line is not necessary but a fast rate of transfer (based on explained last) it.

On the other hand, it's not the data between different offices or between one home and a computer in a house, it's not a telephone line except in a specialized field where data is transmitted via satellite. A telephone line limits the rate of transfer which can be the plan.

## Computer | Fax | Computer to Computer

Computer-to-computer point-to-point communications links, there are three ways to connect two computers.

First, you can use a serial phone line using a modem. Jack-type modems—those that connect to a telephone jack—use a standard 2400-bps data rate. This means that you're paying for more expensive long-haul telephone rates for a slower rate of data transfer. Second, you can use a dedicated line, which is a private telephone line reserved with a telephone company.

Third, you can use a wireless. This means you can use an alternative of the telephone. Of these three, the dedicated line is the most expensive, but it's also the most secure. The wireless line is the most expensive line and therefore a dedicated line is necessary at both the sending and receiving ends. The transmission process is wanted not to be the easiest.

When the software is used depends on the modem you use and the purpose for which it is to be put. Some modems come with software either in ROM or on disk with them. Other modems require you to purchase the software separately.

### Modem | Modem

Before comparing modems, you should first determine what services you want to use. A computer's use depends on other factors, but first to decide what you want to do, then you have to choose a modem. A modem like having an internal modem, it has no disk, the external modems should be chosen to get the modem on what you want to use.

### Modem | Modem

The first thing to consider when deciding on which modem to get, is baud rate. Baud rate is the rate at which data is transferred across and is measured in bits per second (bps). Remember that a single character is made up of eight bits, so one byte of data is the equivalent for machines and computers.

Higher baud rates have two main uses, reducing the number of characters, reducing the number of characters needed to transmit the same computer information.

It's like on a rule of thumb that a character from baud rate to

characters per second (bps) by 10. For example, a baud rate of 1200 characters per second (cps) is equivalent to 12000 bps. The baud rate can be set on most telephones. The baud rate is set on a computer at 1200 bps.

The baud rate is based on the baud rate of the telephone line. The baud rate is 1200/75 and 1200/150.

When baud rates are set on the computer, the baud rate is set on the computer. The baud rate is set on the computer. The baud rate is set on the computer. The baud rate is set on the computer.

The baud rate 1200/75 is used popular in Britain. It has been used in America and other information is set on 1200 bps. The baud rate is set on 75 bps. The baud rate is set on 1200/150. The baud rate is set on 1200/75 and 1200/150.

The baud rate 1200/150 is used mainly for international line transfer and for upload by editors on Fax and CompuLink. This is also used in the USA. CompuLink, Telexnet, and Bulletin Board are used 1200/75.

### Modem | Modem

When getting into too much detail at this stage, it's better to get some words that I've used.

Proced is a service run by British Telecom, yet its information comes from various forms of press releases and hobbyists.

CompuLink is a service run by CompuLink. It is a service run by CompuLink. It is a service run by CompuLink. It is a service run by CompuLink.

Proced is a service run by British Telecom. It is a service run by British Telecom. It is a service run by British Telecom. It is a service run by British Telecom.

CompuLink is a service run by CompuLink. It is a service run by CompuLink. It is a service run by CompuLink. It is a service run by CompuLink.

Proced is a service run by British Telecom. It is a service run by British Telecom. It is a service run by British Telecom. It is a service run by British Telecom.

### Modem | Modem

When deciding which modem to get, the first part to consider is how to interface the modem to the computer. The two main interfaces are RS232C and RS422C.

When deciding which modem to get, the first part to consider is how to interface the modem to the computer. The two main interfaces are RS232C and RS422C. The RS232C interface is the most popular. The RS422C interface is the most popular. The RS232C interface is the most popular. The RS422C interface is the most popular.

## What About the Hardware?

And, perhaps, you'll want to purchase some specialized floppy or hard-disk write-in-the-sun or high-wind, like Photo Disk II. Yes, it's expensive. It is similar to standard other write-in-the-sun or hard-disk drives, but not so portable and so slow, if it's right about the same size as your travel writer's hard-disk drive, and if so, at what price? For the most, why not use something a little bit better than or between the old and the new? Do you want to be able to print the information on a paper (e.g., a screen dump)? And so on.

Finally, there are the more advanced 80386s which are built in one module (e.g., Zenith 386). That is, can you type in the numbers on the keyboard and let the module do the rest. Can the module do everything it can do, or are you going to have to connect it to a board and then it becomes like the module you just got rid of, only more so.

Are there any other interesting and unusual options out there, e.g., Pascal, and Are there questions in the mind of the reader as to the merits of full-duplex and half-duplex? Full-duplex means that the computer can talk to you at the same time as you are talking to the computer, whereas half-duplex is less than a full duplex and then you have to wait a minute and then you can talk again. If you are using half-duplex and your typing appears as wavy, you know that the computer has to wait for half-duplex, however, let you use only what is required on the other computer. Some services use half-duplex, and others half-duplex and so it is necessary to consider this feature with heed and care. You know how you will be using your modem.

## Shopping the Market

Today there are many modems on the market. I will discuss some of them along with the various software packages that either come with them or which can be bought separately. This will provide you with sufficient information to let you investigate on your own before deciding which product to buy.

### The Executive Model

The executive model is a large, high-quality, well-known, easy-to-use model. It is designed to be used in a business environment with a focus on reliability and performance. It is often used in large corporations and government agencies. It is a high-end model with a lot of features and options. It is a good choice for those who want a reliable and high-quality modem.

If you use CompuLink, you'll download faster for less cost. You'll also have various software including software for accessing Prodigy on-line software (e.g., for accessing e-mail systems like TeleMail Gateway and multi-user software like e-mailing lists, from 32 software for personal use available from Y2). This modem can be used with the 80386

or 80486. It is a good choice for those who want a reliable and high-quality modem.

### 64-bit Modem

The 64-bit modem can be used on the 80486 and Pentium. It has a lot of software for it. It can do a lot of things including simulation and emulation which can be very useful for testing software. It has a lot of features and options. It is a good choice for those who want a reliable and high-quality modem.

### Feature

The Voyager 7 is an online being developed for this and will be a serious multi-therapeutic thing. It can do a lot of things and it is a good choice for those who want a reliable and high-quality modem. It has a lot of features and options. It is a good choice for those who want a reliable and high-quality modem.

### Modems from Tandy

Tandy Marketing Ltd has produced five new modems which have a wide area base from the TANDIT which could be used with the AT 99 standard IBM or a cost of £99 compared with the TANDIT which costs £199. Tandy's modems mainly allow all the capabilities of Bond 2.0, with both full and half duplex along with other facilities like local dial, no-time-out, time group numbers and protocols. This means that it is easier for her owner to obtain very simple prices, a range of fees, and the modems automatically dial the appropriate number and they can call back customers as well. In the modems they are still under the name brand.

### Modems from Miracle Tech.

The 64 Multi-modem is a product from Miracle Technology but it cannot be used with other modems. On the other hand the W2000, W5000 and W6000 are 64-bit compatible PC/XT modems. The W2000 costs £199 and has great features as well as all the facilities that have the W5000 costs only £99 and is used available. The W6000 costs more than £200 and it is an about £100 upgrade. They all come with the maximum software to drive both Bond and Ekivision and internal operating software. They are average versions of these modems including some expensive ones which have special features like, dial tone, the bond rate of the best modems and automatic as a default.

### Connecting to a Service

Before putting up your computer make sure that an modem is in place and correctly connected to your computer. Most computers use the serial communication interface, installed on the computer. You may search off first. If you do not connect from some of the steps under the computer. Once everything is physically in place, what the computer you want to communicate with. If the modem cannot dial you follow the manual's instructions and type in the appropriate phone number. If your modem does not autodial then you have to make sure that the phone is either plugged into your modem or into the same jack as your modem

is plugged in. Check type of modem you have. Once you have dialled the computer you have received you will find a high grade which. You then connect the modem by passing a button or a switch.

### Which Service?

We are not here to tell you how to decide on what you want your services to be before obtaining your modem. It is that you have had to decide which company you will want to use. We discuss a broad level of the most common British modems: Provel Computer and Ekivision Gold.

### Provel

This is British Telecom's 2400 data system. It is a full duplex system and is a standard of data is displayed in a time. A series of data is 2400 bits per second and 40 characters wide. Although Provel Ekivision cost the computer which runs the software from the information is provided by various information on Provel's (IP). The IP's information and is not available. As to the Zimbase Travel Bond. The cost of the 4000 page of information on almost every subject including. As a travel. Initial on Bondline Management 2400's Travel and Ekivision.

Name of the IP's Provel as a series in their own computer is Provel management. This is a private link to the computer. The Provel then is the better to access and send in their own terms and send labels to directed software, and to purchase certain items, some of which are not. You can even use the Provel to access. This is a standard 2400, but you can find it independent that is, it is not given. It still includes, make use of some quality and computer.

Provel is also cheap 99% of all people in the UK have local office. Even if you are abroad you can use the phone to access. Computer services are only charged for the time to get Messages to 1 unless. All other times it is free. Most people who are working for the same are charged for their time, which is not as easy as others. Another problem is the fact that the other things which can still come across bonds the Provel subscription of £5 per quarter is the charge for services direct from groups. It is Gold Term. CULos are the others in our experts. The Provel Microcomp-

term. CULos only £10 per quarter and they have very access to locally the number of prices. So for £10-100 per quarter you can access to many more which are applied to separately, and which consists of all kinds of parts. Some services are not available. Provel Microcomping. CULos can be found in many, not as good. Microcomping with is American Radio on the ClubNet card.

### Micromet

The Provel Microcomping £1000 is called by a company called Micromet is the biggest IP on Provel which explains why they can produce so many local things. The advantage for managers who like not to purchase a modem is probably. They provide a modem is probably £150 for the AT, or £100, a modem and software for receiving Provel's 2400's subscription to Micromet and Provel's 2400's subscription to £150. Contact a modem and software. They provide a series for the Commodore 64 £25-75. Amiga and PC, as well as for other modems.

### Component

As it is, you have only the 64-bit modem can be used to access the service. A subscription to Component can cost anything from £9 to £15 a quarter depending on the type of service required. There are other options for you to use, but you are charged with it you have a GOLD account (£10 per quarter). You will not be charged a Gold subscription period and purchase of a 64-bit modem will be provided for you.

This is not local call access for customers but why use Component? Component does not make facilities that Provel does not. If you can buy from and buy them directly in your Country and account to which is something Provel does not. The Component also has an IP but it is not as good as Provel but the information on the website is good to 24/24 users, but is not only in the main Microcomping—there is also a hotline system. Unlike Provel which is not a standard call an optional package which has access to the telephone. Component users can receive packages on an area called the Bondline and without the need to give a

network computers.

Compuart also has a word editor which can be used both online and offline. It has many features and it is the way you print pages from Compuart. Compuart also has a dual-head menu so when you want to run the editor for example, you move the cursor until it gets to editor and then press return. Pressed on the other hand is menu, operated by numbers which originate from the disc which stand through with one alphanumeric. Pressed has several bright icons, words called keywords, or instead of "F1000" you can key "ABCDEF" or "KPLUGH". The menu displayed with Compuart is what it is like, but improvements are being in the version to speed it up.

**Teleport Gold**

This is a word processing package and also it is ideal for sending and receiving long documents or for searching special databases which are

expensive. It is a message. Teleport also looks cheap on Teleport Gold. This is however, contact charges in all times, and there are packages which compared with Procal or Compuart.

For example, after type in the message Teleport Gold (without charges) are three pages a minute. Procal is first and Compuart is about 60 pages an hour (a page is a message). However, more contacts on Teleport Gold as long it is not meant to be a word which you receive, around although various state of useful information and features are provided. Like Procal it can be accessed by F10.

Bulletin Board was considerably and other are sending, or text data compatible software. One of the well-known, readable compatible BBS is Detektor. BSGE's bulletin board for Amateur Radio Hobbyists (Tel 070 57942) Like most Bulletin Board's few phone lines are available which means that you may find it hard to get on to the system as popular times or of course the software can fall over!

**AMAZING NEW 'TOTAL BACKUP' CARTRIDGE FOR COMMODORE 64 AND 128 (IN 64 MODE)**

## NEW ACTION REPLAY V.3 FROM DOSOFT UNSTOPPABLE 'TOTAL BACKUP' CARTRIDGE

**OUR NEW INNOVATIVE HARDWARE AND SOFTWARE COMBINATION GIVES YOU MORE POWER, MORE FEATURES, MORE FUN!!**

**1 Mega-Process**  
1000000 bytes of storage space for your files and programs.

**2 Independence**  
No need to reformat disks when you change software.

**3 Save Fast**  
Save your files and programs in seconds.

**4 Super Compact**  
Only 100KB of storage space for the software.

**5 Picture Save**  
Save your screen pictures as well as your files and programs.

**6 Disk Passage**  
Pass your disks through the software without any damage.

**7 Code Inspection**  
Check your code for errors before you run it.

**8 Compatible**  
Works on all Commodore 64 and 128 computers.

**£14.99**

**Super Software Sale**

Buy 10 or more and get 10% off each item.

**97% SUCCESS WE ASK WHO'S NEEDING WORK?**

DoSoft is the leading software company in the world. We have over 100 products and are growing rapidly. We are looking for experienced software developers to join our team. If you are interested, please send us your resume and a sample of your work.

**FAST DISK UTILITIES • LOADERS • 2-MIN DISK COPY • FAST DISK FILE COPY • FAST FORMAT**

# Freeze - A Jolly Good Fellow?

*Freeze Machine is a combination of two of Evidash Micro's utility programmes encapsulated within a single cartridge. Bringing together Freeze Frame M&F and Lazer M&H enables you to back up your programmes in a form which will reload in seconds rather than minutes.*

By Eric Doyle

**F**reeze Frame is designed to produce backups of any programs that you own including commercial programmes. This obviously covers the question of copyright and profits for both as I prefer to sell to Evidash Micro as well as their legal rights to produce utilities such as this and would not publicly state they do not contain programs there. It stamping the legend **STRICTLY FOR PERSONAL USE** across their instruction booklet then absolves themselves of any legal claims should the purchaser of the cartridge ever put it to the misuse of the cartridge in the field.

It's a bit like having a gun. The purchaser is bound by the law not to use the weapon in ways it was not to use personal items, so someone that doesn't mean that thoughts don't occur and when one does the legal person's weapons system opens for use not the manufacturer. This analogy holds as quite well but I feel I must point out that there is no such thing as a free lunch.

To own a backup you should also have the original program. It wouldn't then have any legal measures? If you had a program then it is not just the simplest programs then package our utility back, programmer Tom Combsler is no one combine the staff of genius but we cannot open the box this last backup copies are baseable.

As a programmer the main application for me here would be the word processing. I bought the Superprint package but it takes 2 minutes 24 sec. to save it up the way I want it. For a long time, but it covers two minutes of not writing code? Could a test load help me out? For with Freeze Machine a copy about 20 seconds using the Lazer loader and 30 seconds without it that I see this could mean my wife-home pay by over \$100 more than enough to cover the cost of the cartridge plus there are all the other programs I see ready to be backed up.

**"It's handy to be able to save and load all my development programmes at high speed and this is possible with Lazer"**

The Lazer cartridge has two even buttons, one brings to the Freeze loader and the other toggles between the Lazerload and Lazerload modes.

In truth I was not convinced that Lazer was necessary for two reasons. First, the Lazerload facility was not significantly slower than Lazer but would, and far more important, the Lazer program file is stored in a locked USB file. This means that under the cartridge as a "host" program is necessary to load it and it always loads at turbo speed. The effect of this is that when your disk drive becomes slightly mangled or some program file is in-

file all of your USB files will be inaccessible and a repair is required. This can be a mess.

Turbo loaders are far more sensitive to speed variations than is the standard loading system. In a system which offers both alternatives in the field and leaves reasons for use. This means the freeze loader in the Lazer cartridge.

Of course backing up commercial programmes is just one use of the cartridge. For a programmer like myself it's handy to be able to save and load all my development programmes at high speed and this is possible with Lazer. I can also Fast-format disks and use the Disk system to search and validate files. The only thing I miss is a built in monitor which would be useful. I'm sure because I miss when to bring the great onset of Evidash Micro's introduction. Dolphin DOS system which in the Lazer look show. Evidash claim a speed increase of over 20 times with Lazer but my own using a standard CBI were nowhere near it.

Inside the Freeze cartridge there are very powerful utility set but some CBI it won't work with every piece of commercial software on the market but a large proportion of them can be backed up. At £29.95 it's a steal!

# Contributions

*So you drive a Commodore? So you've  
written some programs? So (if) haven't you  
sent them to us?*

**Y**our Commodore is always on the look out for new programs, hints and tips, articles and even reader letters. In fact if you have something that you think could be of any benefit Commodore's readers we want to hear about it.

So if you have got something which you think we may be interested in how do you go about submitting it to us?

Below you will find a list of guidelines that will help us to deal with any mail that you send us to us. We don't expect everybody to be the next William Shakespeare but if you do follow these simple rules then it will make our job a lot easier.

If it possible all material sent to the magazine should be typed or printed out on a computer printer.

All text should be double spaced (i.e. two lines should be a blank line between each line of text). You should also leave a margin of about 10 characters around the text.

If on the very first page you should put the following:

Name of the article  
Machine that it is for  
Any extra required - disk, printer etc.  
Your name  
Your address  
Your telephone number

If the top of every page should have the following information on it:  
Abbreviation of the article title  
Your name  
The page number

For example suppose you had submitted an article on Commodore interrupts. You should put something like the following at the head of the page:

Interrupts / J Smith / 1

If there are any additional marks on your text especially underlining.

If you and some of your friends speak English it does not have to be a mark of inferiority but it must be understandable.

If on the bottom of each page you should put the word MORE if there are more pages in the article (MDS if it is the last page).

If it possible enclose a listing of all programs.

Under no circumstances use a staple to hold the pages together. Use a paperclip instead.

Our Programs should be included on either disk or tape. Make sure that you LABEL the magnetic media program so that we have a better chance of loading them if problems occur.

If Programs under 40 lines can be included in the text. If your programs longer than this you must enclose a disk or cassette.

If your article needs any artwork that supply clear examples of what is needed. We don't expect you to be an artist but we do need to see what is required.

If Photographs if necessary should be either black and white print or colour slides. We can take photos ourselves so don't worry about the cost much.

If Submission of any work is welcome. It will have a five letter name that you think may be of use to someone else we welcome it just as much as a full blown six part series.

If Payment is not quite a lot and depends on quite a number of factors such as complexity of program, presentation of program, number of magazine pages it takes up etc. Payment is generally between £10.00 and £20.00.

All payments are made in the month that the magazine containing your article has appeared in print.

If we do find your submission suitable for inclusion in the magazine we will write to you giving the terms of publication, the rate of payment and an agreement form. Please ensure if the form will allow us to use your program in some or possible.

If you want the program returned to you should we find it most difficult for publication, then you should enclose a stamped self addressed envelope.

If The best and most important point to make is "get writing" we are waiting for your articles.

HEAD-TO-HEAD  
CONFLICT

# Using an Epson-type printer with the C64

*The Epson-Type printer is probably put to best use when used in conjunction with a word-processing program such as Commodore's own Easy Script.*

Introducing a C64 to pageinate its messages by a real door. It is necessary initially to obtain an interface cable to connect the C64's user port to the printer's Commodore interface. This can be bought for about £20 (checking some interfacing software) or can be made for about £5 if you are handy with a soldering iron (no separate panel). No expensive overhead controller are necessary!

Connect the printer to the C64 and load up Easy Script. On the usual screen you should see a 'P' for printer type and a 'C' when you are prompted for interface type. From then on the printer responds normally and you may use a number of extra command characters to option the various modes of the printer. Some details are found on the Easy Script disk in the 'MS/PN info' file which you use print out.

## Overriding Problems in Basic

Loading BASIC programmes is a possible problem since Epson printers don't have the special Commodore

control symbols. However, overcoming this is not too difficult - load and run the BASIC extension program supplied with November's *Test Commodore*, load the program to be loaded, and use the C64's own command to convert the listing into a readable format, without special codes. Now open a file to disk or tape and list the program as follows:

```
DESK OPEN 2,2:0 programname
TEXT W ->C640 LIST
TYPE OPEN 2,1:1:Programme.mt
TEXT C640 LIST
```

This writes the program as a text file. If you now use Easy Script you should be able to load this file and print it as normal. This has the added advantage that your listing will have paginations that don't print over the performance. Also you can re-format the listing to indent FOR/NEXT loops etc.

## Without the Basic Extension

If you don't have the BASIC extension

this don't worry any special characters will usually appear in the listing as blank space. If you don't have a word processor then it is possible to use the interface software supplied with the cable. Or run this short program by P. Coates which refers all screen output to the Commodore printer (w/in-std/c64 activated by SYS 49152)

**Making a Centronics Cable**

If you feel that you can tackle this job, making this cable may save you over \$50 on a cable purchased. You will require:

- 1 - A Amplified to use male Centronics plug for the printer and 1 - A Commodore 1541 male port edge connector for the 424 card

Get a 12 core shielded twisted cable (These should all be available from hobbyist electronics shops.)

The two plugs must be wired as follows:

Printer end

Computer end

PRINTER	COM
1	V
2	C
3	D
4	E
5	F
6	H
7	I
8	K
9	L
10	B
11	A

Plus, note: Mismatch the lead length, that is, it is likely to cause problems (usually known as skew error.)

**Easy Script and Epson-type Printers**

If you have successfully connected

your Commodore to an Epson-type printer you may find it helpful to know how to control the printer's special functions to operate from Easy Script. Some of the special characters required to operate an Epson printer are assigned to Easy Script's on-screen functions and Easy Script is used when they display the program.

These functions are accessible by pressing  $\alpha$  D and then one or other key. Other functions must be sent to the printer as a row of characters, usually commencing with the ESCAPE character which is produced by pressing  $\alpha$  D and then the up-arrow which then appears as a reverse "E" (range and "E" for reverse, where applicable).

Note: Functions require the use of other character codes which are not available from the keyboard such as

the ASCII character whose code is 0. In order to use these, the program must produce a special character for each code, and assign that character the required character value.

Easy Script provides up to ten such special characters which can be used by pressing  $\alpha$  D followed by one of the numbers 0 to 9. To define each character of ASCII value 00 to 09, 0 and a value of 07 to 09 is typed. A list of Easy Script codes follows:

$\alpha$  D 00  $\alpha$  D 0 followed by a 0 should produce a reverse "E". When printed this character will not result in an ASCII 00, a capital A. It is useful to define 00-09 as range functions as these ASCII values. Some other printer commands are produced by  $\alpha$  D plus a shift command.

**Controls for Epson-Type Printer with Easy Script**

Half-Printer on	$\alpha$ D $\alpha$ D and $\alpha$ D $\alpha$ D
Emphasized	$\alpha$ D $\alpha$ $\alpha$ and $\alpha$ D $\alpha$ $\alpha$
Underlined	$\alpha$ D $\alpha$ $\alpha$ and $\alpha$ D $\alpha$ $\alpha$
Double	$\alpha$ D $\alpha$ $\alpha$ and $\alpha$ D $\alpha$ $\alpha$
Reverse	$\alpha$ D $\alpha$ $\alpha$ and $\alpha$ D $\alpha$ $\alpha$
Generate on	$\alpha$ D $\alpha$ $\alpha$ each character
Generate on constant	esc "E" 0 until
Generate off	esc "F"
Superscript	$\alpha$ D $\alpha$ $\alpha$ each character
Superscript on constant	esc "E" 1 until
Superscript off	esc "E"
BLINK	$\alpha$ D $\alpha$ $\alpha$ $\alpha$
PICA	$\alpha$ D $\alpha$ $\alpha$ $\alpha$
Justify	esc "G"
Justify off	esc "E"
Proportional on	esc "p" 1
Proportional off	esc "p" 0
NLD on	esc "a" 1

HL0 off	esc '0' n
Disable paper-end error	esc 'B'
Enable paper-end error	esc 'P'
Initialize printer	esc 'B'
8 LPI line spacing	= 12 / 1pB
6 LPI line spacing	= 12 / 1pB
7/32" line spacing	esc '1'
Line spacing n/32"	esc 'A' n
Line spacing n/210"	esc 'D' n
Standard density graphics	esc '1' n <sub>1</sub> n <sub>2</sub>
Double density graphics	esc 'L' n <sub>1</sub> n <sub>2</sub>
Half-density 3/4 speed graphics	esc 'Y' n <sub>1</sub> n <sub>2</sub>
Quad density graphics	esc 'Z' n <sub>1</sub> n <sub>2</sub>
Max. space	= 11 / (line) any any

Most of these commands are self-explanatory, but a few need explanation. Backspace can be used to position special characters by entering the address, character, and / no page. P Line top, n line size indicates that line will print the row number.

Printing multiple graphics characters will draw an empty row to the actual graphics on the LPT. This character is also loaded on a grid whose height is up to 62/34 dots wide. Support software available elsewhere, Greek DPL II.

Note that it requires 7 ASCII numbers to define the character. 7 in Low byte/High byte format is 7 and 0 or 4 (197) + (16256) = 75.

Now we define the ASCII character for each column plus one for the numbers of columns to be used.  $15 \times 250 + 1 = 3750$  (124-02)  $\times 15$ ,  $6 = 1457 = 140 \times 14$ .

To produce the delta on single density graphics we use 11p.

esc & 11 & 31 & 61 & 12 & 14 & 11 & 11 & 11 & 31 & 61 & 12 & 14

To produce the delta on double density graphics we must first double the number of columns so we define

250 & 14

and type

esc & 11 & 31 & 61 & 12 & 14 & 11 & 11 & 11 & 31 & 61 & 12 & 14 & 11 & 11 & 11 & 31 & 61 & 12 & 14

11 & 11 & 11 & 11

The same example holds for quad density graphics.

One final trick - mono printing. This is achieved by using subscript. Default is 1/2 (1-16) with condensed mode characters and also reducing the line feed to about half the normal distance.

Select Condensed mode by using  $esc 14$ .

Select Subscript by using  $esc 5$  or  $esc 0$ .

Change line spacing of about 14/32 and therefore define  $11-0$  as 14 by  $11000014$  square.

Select 14/32" line spacing by using  $esc 4$  or  $19$ .

# Shadow Boxing

Use the shadow area of your computer's memory to improve your Basic storage space

By Rick Ashley

A rather look-liked complaint that can be paid to the C64 is that it has encouraged many a programmer to keep machine code the crux of being fast in some type of program. However, there are programmers who do not necessarily think that a need to machine code is a programming step. To meet these programmers' needs, many machine code routines have been written which augment the C64's Basic. The following describes three such.

The program has been written in assembler that the 64K of Basic bytes can be searched, deleted by its need to store data. This data may represent a numerical or text information, pointer or perhaps screen data and associated value memory. The 4K of memory from 4096 to 45747 which can be added is nevertheless rather limited. The programs we are to meet here know by memory: MEX, MAYE and MAVE under the 16K RAM hack in the shadow of the Basic interpreter much more available in Basic.

The shadow memory referred to, between 4096 and 49151 and known as LORAM, is usually, probably empty, or POKE'd in to the normal way. The C64 knows that it is safe to try to write to ROM, and so responds to any attempt to do so by switching the ROM out and the RAM in to receive

the POKE. The Cash 25 with LORAM is that in order to PEEK it you need to switch the ROM out, however, the ROM is the Basic interpreter and with it switched on the PEEK instruction cannot be understood.

The answer is to write a short machine code program which can access the Shadow RAM. The program here is called MEX (short for Memory Exchange). MEX will exchange any contained segment of memory for any other of identical size. If a chosen area includes the area 4096 to 49151 then LORAM will be exchanged. This allows the Basic programmer to LOAD or POKE data to LORAM (your data perhaps of a screen) and when required call MEX and swap it for similar data which is not required for the moment and which is in memory-accessible to Basic. No data is lost, calling MEX again will exchange each byte back to its original place or to some other position if you change the parameters.

Before using MEX's parameters to do so, on three pages of information, the number of 128-byte blocks to be exchanged and the two addresses from which they are to start.

As an example, suppose you wish to swap the 91 bytes from 1216 to 4095 for that in LORAM from 4096 to 4915 inclusive. First remember that the area 1216 to 4915

would have been processed linearly, consecutively. If you want to use it for data storage, the first 16 POKEing location 17 (the bottom of string storage) and to the highest address used by Basic with 128 characters (1276/1276+128) before 4096 are programs. The rest of the memory to be exchanged is 86 which equates to 671028 or 4192 on the number of 128-byte blocks involved is 4915/128 which is 37.

Your program has now had something like this:

```
POKE 42,128:POKE 44,128
MEX 4096,1276,4915,37
```

MEX is quick, portable, and although it has been put in 10000 and is called by 555 5000, it may mean to wherever you wish by changing line 10 of the basic loader, and modifying the 555 statement accordingly.

## Swapping from Memory

MAYE is the Memory SAVE program. Unlike MEX, which RUN from within your program, MAYE uses a small amount of your memory, but is not needed within the program. However, like the other two programs, it may be moved to any convenient area in the memory explained here. It uses a disk drive, the cassette buffer is available to you and it has the

SAVE is outside your main program/data area.

SAVE is called by the immediate command:

```
SAVE 50075 SA,EA,"FN",DN
```

where SA is the start address (usually 0001), EA is your end address (+1), FN is your program name, DN is the drive disk number (1 for cassette or normally 8 for disk).

Where SAVE differs from other SAVE utilities is that, should you have data stored in LOORAM that will save data rather than the basic interpreter ROM.

### Overcoming LOAD Problems

Unless you're into it as a disadvantage, it's not a waste of time when I LOADing to LOORAM. The LOORAM loading system will LOAD your data into LOORAM, but the data is recorded twice on your tape, and at the second pass the system compares the tape data with that supplied. LOORAM on the first pass. This is normally a good check for LOORAM errors, but when loading to LOORAM the check is made on equal bits the contents of that area but against the ROM above it. The result is an error message which you can generate on many disks, more so which stop a program if the LOAD is stuck from within it.

LOADing data into high memory from disk can also be a source of confusion, but for here the difficulty comes in immediate mode rather than from within programming. The problem usually itself is an out of memory error, the reason assuming that because the level data was high on memory, something below it will.

VS550 overcomes both these queries. VS550 starts 110 bytes after MEM and so if you keep the basic loader starts at 0000 and then make the variable \$Y equal to 0052 you will see as follows:

```
VS550 "NAME" 1 1  
let tape  
VS550 "NAME" > 1  
let disk
```

MEM, NAME and VS550 have been kept quite simple using error messages only as a reason on the 64 to check this will not take hours to type up or to work from. Loading SCREEN TEST into disk is a straightforward thing and program that use with the short basic program, listed here, called SCREEN TEST 1 and SCREEN TEST 2.

### Testing

The LOAD and RUN SPANDOR and if the computer responds with OK! click the basic loader with NEW Next type is SCREEN TEST which operates as follows:

```
Line 10 sets the character columns.  
This line is repeated only on odd  
C64, if POK! ROM 168 on a freshly  
initialised computer does not  
produce a square, at the top left hand  
corner you will need the line.
```

```
Line 18 sets the variable MEM to the  
start address of the program.  
Line 20 draws a series of vertical lines  
into the screen.  
Lines 30 through 48 draw a similar set  
of horizontal lines in LOORAM.  
Line 49 the SYS command directs the  
program to the routine, MEM, the  
memory to be exchanged to start at  
0052 (the current) and 0000 (the  
start of LOORAM) and the amount of  
memory enough to be 4 blocks of 256  
bytes which equates to 0024 (which  
one screen - worth of data).  
Line 50 assumes that the exchange  
errors while the thing goes which  
translates the 1 % portion of the  
screen.  
Line 60 loops back to re-exchange the  
data.
```

### SAVE and RUN SCREEN TEST

Main line checks the vertical lines are  
drawn in lines and sets a link, begins  
the horizontal lines to be drawn in  
LOORAM. As soon as MEM is called  
because of the speed of its machine  
with program it immediately  
exceeds at a distance, but under the  
vertical and horizontal lines then  
write to LOORAM. In fact the speed  
of exchanging program a diagonal  
pattern which is even more apparent if  
line 50 is deleted.

Now press EDIT, STOP and SAVE  
the pattern in LOORAM with  
SYSTEM-INITIALISE PATTERN 1.  
If using disk, then if left digit should  
be set to 6. As with standard SAVE  
numbers you may add a third 1 as a  
secondary address to ensure that the  
pattern LOORAM back to the memory.  
from which it was saved. This can  
also be achieved by adding when  
LOADing.

Now modify SCREEN TEST 1 to  
make program called SCREEN TEST 2  
to be the new program.

```
Line 10 is simple as set to memory.  
Line 18 covers the program RUN-  
from line 20 after LOADing  
"PATTERN".  
Line 19 has to be added VS550 with  
the LOORAM routine and is actually VS550  
where $Y = 0052  
Lines 20 to 30 are modified to draw  
a diagonal pattern which
```

contents with the keyboard or  
 copy all bytes with READ using  
 LOAD and PATTERN.

Less. After no longer used and should  
 be deleted.

Lines 70 to 90 system unchanged.

When use RIMAM, RE-IDENTIFY?

```

PROGRAM SCREEN TEST
-----
70 1 1000 SCREEN TEST

```

should first RE-IDENTIFY the SAVE'd  
 PATTERN, without the above  
 message, which would result in error  
 from a tape LOAD and LOAD.

Next the original pattern will be  
 drawn, after which MIXX starts  
 swapping the pattern LOADED into  
 LO RAM with the original data in its  
 last 20 to 30.

In the above each a MIXX,  
 MAZE and SHASH have all been  
 read. Each however may be loaded  
 elsewhere in memory, either  
 independently, or as a single program.  
 To do this change line 10 with Beta  
 loader. Once loaded, MAZE can be  
 read in SAVE, each one as routine,  
 each program as was done with  
 PATTERN.

Next the position of each  
 program when loaded using  
 SHASHM.

MIXX runs from 0000 to 0074

MAZE from 0075 to 0154

SHASH from 0155 to 0180

The ability to use LO RAM was:

the Beta programmer continues  
 READ from 0000 to 0074 was for the  
 100 bytes used to store the address  
 described here. Used differently using  
 different Beta programming would  
 produce completely compatible code  
 that do not exist look at speed.

```

# Code Comfort

*York Electronic Research is a small company, specializing in hardware and software utilities which are worthy of more attention. The latest releases include a 6502 assembler and a Z80 compiler for the C64.*

*By Eric Doyle*

**T**he 6502 Assembler from York Electronic Research (YER) is a neat little two pass assembler which eases the problem of coding considerably, by allowing labels to be used. This means that subroutines can be called by giving them a name of your choosing and variables used within the routine can also be named. It's easier to explain than to example.

Let's use a short routine for clearing four bytes of the C64 screen as an example of assembler code:

```
CB00 LDA #00
CB02 STA $330
CB04 STA $331
CB06 STA $332
CB08 STA $333
CB0A STA $334
CB0C STA $335
CB0E DEY
CB10 BNE $C00A
CB12 RTS
```

In YER assembly code the become:

```
0001 ORIG=4912 :clear(1) or SC000
0002 SPAC=10
0003 SCREEN=1024
0004 WIDTH=40
0005 :NOTIME STARTS HERE
```

```
0006 LDY #WIDTH
0007 LDA #SPAC
0008 CLEAR STA SCREEN-1 Y
0009 STA SCREEN+96 Y
0010 STA SCREEN-96 Y
0011 STA SCREEN+114 Y
0012 DEY
0013 BNE CLEAR
0014 RTS
```

As you can see the purpose of the routine is much clearer and therefore to include RPN style statements following a colon colon adds to the clarity. The main advantage is that jump and branch instructions use a label, not a fixed memory location. This means that adding a line within the program automatically adjusts the call, accordingly, on assembly of the final code. Unfortunately, however, by simply changing the ORG address, the assembler will then use this as the base address for all jumps and branches.

Although I've not tried the YER assembler it looks as if it has the advantage of having 99% of memory free for program workspace. Add to that the fact that programmers can be assured some one another has not been on the power that the utility contains.

There are only fourteen editor commands:

```
A - assemble current source text
B - return to Basic
C - specify a source file
D - delete lines
E - edit a line
G - get a file from tape/disk
H - load text for a string
I - insert new lines at text
L - list a line set L
N - clear memory (new)
O - replace text (old)
P - save text to tape/disk
S - define output device
V - list text to screen
```

Some kind of DOS to call up disk directories and screen presented files would have been a sensible addition, but this would be at the cost of assembler program space. At least you can always search back and forth from program control to Basic without disturbing your assembler code.

Within the actual assembler listing the normal operational code work as expected but there are no directions to save program writing.

```
LOP
LON
CHM
DDG
```

DDG  
DDW  
NFC  
PDA  
DDO  
DDT  
DDJ

An assembly code programmer using LDF and LDM always knows exactly which memory address will be used to go to the memory screen. As pointing to the screen takes time, a significant amount of available time can be gained by suppressing the screen display of the code when the assembly option (A) is employed.

CHN and BEG always appear at the end of programs when several

blocks are chained together. CHN tells the assembler to load the next part of the chain during assembly, and BEG is used at the end of the final part of the chain within the second pass run to be loaded from the first part program of the assembled chain.

The reason the chain has to be loaded twice is that the first pass sorts out the blocks and their relative actual addresses in the assembled code. The second pass is to insert these final addresses into the code as it assembles.

DDY and DDW are used when look up tables are required into a binary DDJ stands for Define Binary and assembles following the command will be used as it is memory bits of

string of bits. For example DDY let "BEADJ".

This would cause the chain screen (147) value at the first byte followed by each value for three and BE ADJ as the following is a memory location.

DDW is followed by a screen of table screen used in the program. At assembly time the program scans the first and low bits of the memory locations of the label as a look up table.

SPC is followed by a number which allows a gap of up to 256 bytes to be placed within a program to leave space for variables and arrays.

At assembly time one has two options. The code can either be placed directly at its final address or stored in a large buffered relocation program.

The straightforward manner assembly is directed to the start address in the POC command. In our screen clearing routine POC 0412 would cause the assembler to try to place the code directly into memory. In this case it clashes with the storage area of the actual assembly program would cause an OUT OF MEMORY message to be generated leaving the rest of the loaded assembly loaded.

DDW assembles the program in the low level programming area provided by a routine which nullifies a table of code to its own memory address when RUN is entered. The DDJ command can also be used for final the level program to jump to the new code within memory to cause a SYS command.

On the whole the assembler works well but occasional at a low level is a long winded affair. If an error has been referred to line 0006 of the program the correction must be made with the line:

```
15 1st correction line
0006 LDM #WDTM
D1 delete that mac line
E      error a line
0006 LDM #WDTM
```

The instructions are good but the idea of having assembled code in low level is inefficient design. There is no way within the program to use the assembled code for a table to flow, then be made and a program then be made using the normal BASIC command. None of the get a routine which could contain a big number and it took me a while to work it out for myself.

My criteria for the Top Electronics Review's Assembler is one that I would recommend for someone making their entry into machine code programming. All of the essential features are included within the program, and there are not enough commands to confound a novice.

### The 286 Emulator

The second of YER's products is the 286 Emulator. Before going any further I would just like to say that this is partly an educational aid. There is little possibility of transporting the code directly across to a Spectrum or Amstrad machine. This is an emulator, not a simulator.

For a long time after purchasing 6902 machine code I was asked to try 286 code but I was inhibited by the fact that I'd have to buy another computer just so I could try this emulator had been available then I would not have had to shell out a fortune on a machine I don't really need.

The YER emulator is really a compiler which takes each 286

instruction and translates it into a corresponding pseudo-6802 code from a library, stored on disk. It's a bit like taking results in the news that computer takes the lines, types and translates a corresponding page of code. The result is that the program runs more slowly than a dedicated machine code equivalent as is the case with this emulator. A compiled 286 program runs at about a sixth of the speed of a dedicated 6802 machine. Not that this matters a great deal as long as a file is well enough to allow if the 286 coding would work.

The 286 assembler is a lot more flexible than YER's 6902 equivalent and includes facilities such as search and replace, a simple editor contained here/divisional/binary calculator and a complete DOS support.

The actual translation listing follows during the same session as is laid down by the 6802 assembler except that the code follows the correct 286 instructions as is.

Any emulation of one CPU by another is liable to compromise in the interests of speed and efficiency. In

this case only the essential 286 flags are supported, interrupts are not supported. With the exception of the IR part all of the CPU registers are supported including the two 16-bit accumulator set of registers. The net effect of these omissions is that some of the commands cannot be supported by the emulator. This is limited to 20 specific commands and doesn't cause any problems in running 286 code.

After writing your code in the assembler editor you then move it to disk and load the emulator program. The emulator produces the object code which in turn is converted into the final 6802 version by the special save program.

This is a novel and relatively cheap way of becoming familiar with the 286 environment.

See us at PCW show  
— Stand No. 1511 —

It's a very simple, but very effective, game. The graphics are good, especially the fire, and the controls are straightforward and easy to use. However, the game is a bit slow and the graphics are a bit blurry. The controls are a bit tricky, and the game is a bit slow. Overall, it's a good game and it's well worth a try. **4/5**

## ZYNAPS

**Z**ynaps is the latest shoot 'em up from the same company that was first to give Scorpion fighter through screen after a run of alien-quadrant camouflage-polyfighter-ship-and-planet installations that showed you as bombing and/or laser missile.

Your Scorpion fighter is fitted with a standard missile launcher but also a fuel scoop that can absorb the enemy's missiles left after a wave of alien or ground installation is destroyed. Collect enough of these and you could add in other weapon systems, such as more speed, greater firepower, bombs and bombing missiles.

At the end of each sequence you will have to fight your way past a mothering or a camouflaged vessel that can only be destroyed by several well-aimed shots or by bombing missiles.

As you blast alien and vessel their molecules as well as the background structures that are just another in our ship will get 'vaporized' and 'vaporized' but so will the opponents you'll face.

Although Zynaps will give you a better feeling of a good work out it is a little more than a Monero variant. It is good but we've come to expect more than this from Phoenix.

## ZOLYN

**D**o you remember an arcade game called Qix that was then converted for many machines possible in a bewildering array of names that all ended in the letter 'X'? Now here comes Zolyn which is the same old annoyingly addictive game that I just can't stop playing.

The game is on, really simple. All you have to do is point 10% of a screen by moving your hole and blowing off sections which then turn blue.

Naturally, there is a catch in the shape of a fly, zapping both that cost you a life if they collide, with you in a box that you're releasing with the white line that follows your movements in clear territory. Lose your lives and you lose the game.

If you manage to complete a screen then you're on a sled

with a bonus life and you're onto the next screen which has even more balls to avoid.

A simple but addictively addictive game. **T.H.**

## TABLE FOOTBALL

**H**as anyone played those table football games where the pieces are controlled by turning handles? Well now you can bring the excitement into your home and enjoy your computer table at a budget price.

The game is only a two player game, in which left and right joystick positions move the selected handles in the one or the other the left and forward and back, to kick.

The game is a host of nice goals, each with the camera view displayed on the pitch and not in the usual of view about the table.

Before you try the first software house to attempt to compare, table football indeed. Builders have produced a great version called Kickoff. This is not a good version for two amazing reasons.

Firstly all the players kick and then standing up right but you can't kick all your own unless you kick it. This is of course nonsense and spoils the game as well as stopping the players stopping and controlling the ball and using the press, you a kicking match. Secondly, should you score a goal phase can some times be scored by kicking the ball past the goal? Your opponent may get the goal or occasionally both of you get it!

Even if the program wasn't bugged, it just wouldn't be worth the money even at a budget price.

# The Personal Choice Collection

*A trio of packages for the home or small business user which includes a word processor, database and spreadsheet program that can be used separately or integrated through common files*

*By Tony Hetherington*

The collection is supplied in a library box, so each program accompanied by a quick reference guide. Also included is a printed computer with worked examples and tutorial screens that take you through the basic operating instructions, and then some advanced features and finally how to interface with the other programmes in the collection.

## Writer's Choice

Writer's Choice is a full featured word processor capable of handling complex documents with headers and footers, paragraph search and replace, formatting and a 40,000 word spell checker!

Once Writer's Choice has loaded, you are presented with a screen to write a document. To make a page, LOAD/SAVE or PRINT a document or format a block, del, or produce a new print. You can then scroll, write a letter, enter or replace article and insert typing mistakes, copy, move or delete blocks of text by pressing a few keys.

A Writer's Choice document can consist of 255-48 characters lines that appear on the screen as dots and lines, an over-views. This should be enough for most applications but if it isn't, you can chain documents together to form massive documents, that can be printed out on almost every combination of printer and interface.

You can also find as files created by File's Choice and Planner's Choice and incorporate them into reports or use the File's Choice data to form a mailing list.

Writer's Choice is probably one of the easiest word processors. I have not used other's often, a help file, as much as you get stuck in it, however some simple

instructions and commands. For example the search and replace command the 'del' and 'del' and 'The' has the command 'del' is even more powerful as it finds part words such as 'The' and 'number'.

Once you've created your letter, memo or article you can preview to see what it will look like on paper and then check it with the impressive Spell Right and get a word and character count.

Spell-Right is supplied as a separate disk so you can use your documents and then load it in for checking. The Spell-Right disk is double-sided and both must be used in turn to check words that begin with letters from A and N and O and Z. This takes a while particularly if you've added your own dictionary to the 40,000 words that are already checked.

Once the program has located its highlights, you can edit them. There can be alternate, special or added to another dictionary. If you don't know how to spell a word, you can look, maybe go, and have that checked or you can even get Spell-Right to list all the similar words it can find for you to choose between.

### File's Choice

Every integrated package needs a database program to store and organize information so that it can be updated, sorted into order and then printed out by the word processor.

A File's Choice database consists of records that are created by typing on a screen and you're between 30 and 80 lines long. To create a database you simply have to type on the screen the records you want to keep and then save them to disk. You can then add new entries, delete records or edit existing ones, and the whole info runs alphabetical order (so whatever is deleted or field found search for specific record or group of records, by setting greater than and less than parameters).

Once you have the information stored in a format that's easily edited and updated you'll want to do something with it such as create mailing lists and print out labels and other reports or lists. Creating a report is done as the program presents you with a list of the fields in each record in your file and all you have to do is put them in the order you want them as a page form. You don't have to include all of them (looked a awful printout is a list of phone numbers) and you can load the computer to print more than one on the same line. The report is printed out on three by five and on the screen, scroll to disk to be used with Word's Choice or printed out directly.

### Planner's Choice

Planner's Choice is the third and final part of the application program package and features a fully budget spreadsheet program for all things your finances and taking those "what if" questions. What if VAT goes up, what if the cost of drink doubles, what if I sell 10% more pizzas, what will happen to the price, Mega Game? The answers and many more can be printed and analyzed by a spreadsheet.

	JANUARY	FEBRUARY
White Bread	214.00	212.00
Milk	12.44	12.44
Eggs	2025.84	2150.00
Tea at 100%	1000.00	1000.00
Sugar	300.00	300.00
Breadmaker	2000.00	2000.00
Grand Total	5552.28	5574.44

The user and implementer of a word processor and a database are obvious, but who would use or need a spreadsheet? The answer is that you don't need a spreadsheet and you should budget to get from using a spreadsheet. Club treasurer, comparing investments or home and car accounts are all made easier by using a spreadsheet and even if you're planning to run your own business, a spreadsheet program will impress the bank manager.

Unfortunately the spreadsheet screen looks daunting with only a few keys that outline the cells of the program's work space. In some the Planner's Choice manual you'll learn that each of these cells can contain text or heading so that you understand what's going on; figures and formulas to add up the contents of other cells or perform calculations. With these you can add up the column spaces you've entered or deduct the heading and lighting bills and sum of your club house and find out how much you've got left for toys or equipment and see whether this figure is increasing or decreasing, in which case you'll have to increase your sales. Sometimes a business's own calculator profits, expenses and wages to set prices to keep the business at breakeven and ready for one day's work as the Club's for donating to giving beer party or VAT.

In changing a single figure you can create a whole different set of circumstances which the program can recalculate in seconds giving you the new results and a jump sheet of the spreadsheet.

Once your spreadsheet is set fine you can either save it to disk and incorporate it into a word processor database or print it out individually directly from Planner's Choice.

The Personal Choice Collection is a powerful trio of packages that will get your Commodore working. There is also a CD-ROM version that loads automatically from disk that beautifully extends the screen size from 48 to 60 characters. The collection is a little expensive at \$89.95 but does contain all you need to write documents and check the spelling, store information and get your finances into shape. The packages are easy to use and are supported by some superb documentation.

# Arcade Action

*Producing your own scrolling messages and plotting on the screen.*

*By Tony Crowther*

Scrolling messages have become commonplace within game programs. Such messages can range from game instructions to simple blunders about friends and other programmers. Here's a routine that allows you to scroll a message up to 255 characters long across the top of the screen.

Drawing borders and lines, and doing it quickly, is very important in games writing. So I've also presented a routine that enables you to plot small blocks extremely quickly at any point on the screen.

## Get It Scrolling

The routines presented here for scrolling messages is nothing to snap up and down and about about. However it is a simple but effective way of producing your own scrolling messages.

As usual there are three programs associated with the message scroll routine. First, we have the Basic loader, called MESSAGE LOADER. This routine holds the necessary machine code within Basic DATA statements. These are then POKED into the screen area of memory when the program is RUN. The second listing, MESSAGE M/C, is an assembly version of the program so that those of you interested in machine code can see how the program works. The third routine, MESSAGE DEMO is a simple demonstration that shows the program in operation.

## Using The Routine

The scrolling is extremely simple to use and should cause you no problems. It does require the IRQ DATABASE routine to be in memory before you RUN. For those of you who missed the IRQ DATABASE in the March 1987 issue of Your Commodore, I have included it here. To use the routine you should follow the procedure:

- 1) POKE 1790
- 2) Clear the screen.
- 3) Print the message onto screen(255 character long)
- 4) Type SYS 38617, COLOUR SPEED
- 5) Clear the screen
- 6) POKE 688, 1 to restart the message on

The values for COLOUR are the normal colour codes as described in your manual.

SPEED should be between 0 and 5 where 0 means stop and 5 is fastest. If you are still unclear as to what you should do read the example — it should make things clearer.

## Screen Plotting

The second routine presented here allows you to plot a quarter character sized block, 4 x 4 pixels at any specified position on the screen in any colour.

At first glance this routine will appear to be of little use in arcade programming, however it will become invaluable when drawing borders or lines on the screen.

Once again three programs are presented. The first, PLOT LOADER, is the Basic loader for the PLOT routine. The second program, PLOT M/C, is the machine code version of the program. As usual a demonstration is included, PLOT DEMO, showing the program in use. The system set this routine is as follows:

SYS 38616 X Y COLOUR  
where X is the range 0-79 and Y is the horizontal co-ordinate for the dot. Y is in the range 0-49 and is the vertical co-ordinate of the dot.  
Colour is a standard colour code (0-15)

## Brought Forward

In the last grouping episode I set you a couple of tasks to perform with the routines that I had already published. I am sure that you all managed to carry out the specified tasks without too many problems, but as you may doubt I have included here my versions of the programs.

The first program, DEMO EXTENSION, links together the routines discussed and produced several moving sprites. The second routine, BELL DEMO, gives a fast month's sprite around the screen.

If you couldn't get various sprites moving then following these programs through should make life easier.

PLEASE REMEMBER before you RUN any of these programs, you must have the relevant routines from my previous articles in memory or your computer will crash.

# Cut Price Disks from Direct Disk Supplies

from only £70.95 for 25 disks delivered to your door.

Cash 'n Carry prices on disks from Direct Disk Supplies

## OFFER 1 Premium Universals One disk for all reasons!

The Premium Universal disk meets all IBM PC/XT/AT compatible hard disk needs meeting high quality needs (1000000 bytes) (5000000 bytes)

25 disks	£ 14.95
50 disks	£ 27.95
100 disks	£ 50.95
200 disks	£ 99.95
500 disks	£ 179.95
1000 disks	£ 329.95
1500 disks	£ 479.95

Formatted MS-DOS 5.0 compatible with emulators, labels, MS Advanced Functions. Disk individually wrapped and sealed for both IBM & AT/XT format to problems and higher reliability Lifetime Warranty.

ALL PRICES INCLUDE VAT DELIVERY TO YOUR DOOR! NO PROMOTIONAL FEES!

## OFFER 2 Rainbows

Save 50% on disks in each pack. Lifetime performance to meet your data and program storage needs. Individual color-coded disks for the rainbow (1000000 bytes) (5000000 bytes)

25 disks	£ 14.95
50 disks	£ 26.95
100 disks	£ 49.95
200 disks	£ 99.95
500 disks	£ 179.95
1000 disks	£ 329.95

Formatted in MS-DOS compatible with emulators, labels, MS Advanced Functions. Disk individually wrapped and sealed for both IBM & AT/XT format to problems and higher reliability Lifetime Warranty.

## OFFER 3 Flippies

This is the disk for saving! Rainbows are available in 1000000, 2000000, 5000000, 10000000 bytes (1000000 bytes) (5000000 bytes)

25 disks	£ 18.95
50 disks	£ 32.95
100 disks	£ 59.95
200 disks	£ 119.95
500 disks	£ 239.95
1000 disks	£ 479.95

Formatted in MS-DOS compatible with emulators, labels, MS Advanced Functions. Disk individually wrapped and sealed for both IBM & AT/XT format to problems and higher reliability Lifetime Warranty.

## OFFER 4 Highgrade Combies & PC Preformatted

	Highgrade	PC Preformatted
25 disks	£ 17.95	£ 18.95
50 disks	£ 32.95	£ 33.95
100 disks	£ 59.95	£ 59.95
200 disks	£ 119.95	£ 119.95
500 disks	£ 239.95	£ 239.95
1000 disks	£ 479.95	£ 479.95

Preformatted individually certified for IBM Highgrade Combs for the PC using premium quality of budget prices.

Why wait yourself and buy from someone else? Buy disks direct from the maker & save thousands when you need it.

## OFFER 5 Bargain Box

Price per disk 95c Approx 1000000 bytes (1000000 bytes)

25 disks	£ 19.95
50 disks	£ 35.95
100 disks	£ 65.95
200 disks	£ 125.95
500 disks	£ 245.95
1000 disks	£ 485.95

Formatted MS-DOS compatible by IBM 1000000 bytes (1000000 bytes) other sample is available. Certified premium quality IBM disks from factory fresh wrapped and sealed.

Spokes are decorated with the Direct Disk Supplies logo.

## OFFER 6 - 3.5" Media Life Disks NEW LOWER PRICES

# Adventure Kit

*Want to write a gripping adventure? This series will provide a kit of machine code routines which will simplify the procedure and enable you to develop an individual style. We start off with the location/exit module*

**A**s many of you know, there are a number of packages around which are aimed at making adventure writing easier. The best known are Quest and Graphic Adventure Creation. With these, all you need to do is think up the plot and the rest is done for you. The main drawback with these products however, is that the adventures written with them tend to have a similar feel and you are constrained by the supported limitations of each package.

In creating an adventure is a data base which is accessed during the game. The natural part is the need for efficient and rapid access of the data held in it. This aspect will be tackled by this kit. This will leave you more time to work on the flow of the game and the addition of embellishments.

The kit comprises of six modules:

- 1 A location/exit module which allows the handling of the geography of the adventure.
- 2 A text module which handles messages, location descriptions, etc.

- 3 An object module which deals with actions as taking, dropping, using, drinking, objects, locking and unblocking.

- 4 A parser allowing the input of commands and the checking of words against a vocabulary.

- 5 A window module allowing the manipulation of screen windows so that you can ease or scroll different text areas.

- 6 An interrupt module which will build in a real time element into the game.

Naturally you don't get something for nothing. The machine code will need about 9K leaving you about 6K, for BASIC. The routines will, however, give you instant access to 20K of memory via the game database.

Each module will be accompanied with an editor allowing you to set up the data base. However, I'll go through the setting up of an editor in sufficient detail to allow you to write your own.

## Location/Exit module

All adventures need some way of giving you the power to move about. This is done by using locations. Each location may be considered to be 4 rooms or not linked to its neighbours by routes. It is necessary to specify your set of data:

- a) which exits each location has,
- b) where each location leads to.

The month I will deal with the first set of data and over the second set at a later date.

Two possible exits are available for any given location. These are the right hand compass directions and up and down. These are described as two bytes for each location. The first byte has a bit allocated for each compass bearing.

North occupies bit 4, south-east occupies bit 1 and so on. This information is held in a table of 256 bytes ranging between 11612 and 11637 (55940-55965)H. Location 0 uses the first byte in the table (11612) and location 255 uses the last byte (11637)H. Up and down use the first two bits of

bytes stored in a table from \$7000 to \$0017 (\$0000-\$001F). This works in the same way as the other table.

The destination data occupies either more memory. Each location has one byte reserved for it. These hold the number of the location reached a less moving in any of the possible directions. If no such data exists, the byte value will be zero by default (zero on that table). The table starts at \$9300(\$B140) and occupies as much memory as requested by the number of locations used. If a full complement of 256 locations is used, the table will end at \$9F04 (\$D704). Location 0 uses the first two bytes, location 1 the next two and so on.

The code in this module uses these tables to provide four functions. This routine prints the data in any given location on the screen. The output of the command is:

```

SES 4664,LOCNO,PRINTTEXT,X,Y
LOCNO is the location number
PRINTTEXT specifies the form of the display. Type B prints the data across the screen using commas to separate them.
    
```

Type I prints the data in a column in a form suitable for use in a window. X is the horizontal position of the top left corner of the output. It is ignored in type B output. Y is the vertical position of the output.

**EXTEND.**

This checks whether a certain table is there or not. Location 900 will contain a zero. If the cmd does that, it will contain 255. Its syntax is:

```

SES 4667,LOCNO,DIRECTION
LOCNO is as before
DIRECTION specifies the direction you want to move:
0 North
1 North-east
2 East
3 South-east
4 South
5 South-west
6 West
7 North-west
8 Up
9 Down
    
```

An example of its use would be:

```

100 SES 5007,$LN,DI
110 IF PEEK(900)=0 THEN PRINT
"YOU CAN'T GO THAT WAY"
    
```

**CHANGE**

This allows you to enter or correct an error during the game. Its syntax is:

```

SES 4670,LOCNO,DIRECTION
ACTION
    
```

LOCNO and DIRECTION are as before. ACTION specifies what will happen. A value of 0 clears the data and a value of 1 inserts an error. An example of its use is:

```

200 SES 4670,3,1,1 PRINT "A
ROCKFALL SEALS THE
PASSAGE TEXT"
    
```

**CHDIRCT**

This command checks the destination entered if you want to move in a specified direction. The number of the destination is held in location 901. The syntax of the command is:

```

SES 4677,LOCNO,DIRECTION
The routine does not check whether an error exists, you must do that. The following code fragment assumes that your current location is in LD and attempts to MOVE you in direction DI.
100 SES 3667,$LN,DI
110 IF PEEK(900)=0 THEN PRINT
"YOU CAN'T GO THAT
WAY" RETURN
RETURN
120 SES 4677,LD,DI,LO=PEEK
(901) RETURN
    
```

The code is provided as a normal BASIC loader but you will no doubt wish to save it as object code. For those of you with machine code monitors, save the block from \$9000 to \$902E. The editor includes a small saving routine which can be used for the job. What you do is:

- 1) RUN the editor and select the SAVE option.
- 2) When prompted for the file name, seek out of the editor with RUN STOP/RESTORE.
- 3) Give the command:

```

SES 870 $filename,$L,$M664,$7064
if you are a disk user or
SES 870 $filename,$L,$M664,$7060
    
```

for cassette. The resulting code can be loaded directly by:

```

LOAD $filename,$L or LOAD
$filename,$L
    
```

The editor is messy driven and therefore self-explanatory. A few points should, however, be made:

The standard table option fills the data tables with one byte. Since the destination table is of variable size, you must specify the highest location to be used. This table is used to decide how much memory must be saved later. The program does not save the number of locations. You must remember it since you will be prompted for its value when you use the LOAD option.

The display location option lists the destination and exit status for the specified location. The set up option allows you to specify the data and destination. You should set up the exit first. The destination portion will clear and you to specify the destination for each available exit.

If you plan to create an exit during the game, use the editor to create the exit and the destination and then use the editor to clear the exit. The destination entry will be retained for when you need it.

The thing to remember is that you should plan everything as proper before using the editor. Changing destinations can't be started work may not always be possible. The final code fragment puts three of the commands together in a simple routine for moving about.

```

10 DATA $LN,$E,$E,$S,$W,$NW,
WUD
20 FOR I=DOWN TO 0 STEP 1 NEXT
I:LO=1
40 PRINT CHR$(147) PRINT
"LOCATION"LO
50 SES 4664,LO,DI
60 INPUT "A HIGH WAY"DI:DI=0
70 DI=DI+DOWN THEN 300
80 DI=DI+UP THEN 200
90 GOTO 60
100 SES 4667,LO,DI,PEEK(900)=0
THEN PRINT "YOU CAN'T GO
THAT WAY" GOTO 60
110 SYS 4677,LO=PEEK(901)
GOTO 40
    
```

That's all for now, see table 1 will look at your storage.

ADDRESS	HEX	ASCII
20	0000	FOR=DOWN TO 0 STEP 1 NEXT I:LO=1
30	0000	PRINT CHR\$(147) PRINT "LOCATION"LO
40	0000	SES 4664,LO,DI
50	0000	INPUT "A HIGH WAY"DI:DI=0
60	0000	DI=DI+DOWN THEN 300
70	0000	DI=DI+UP THEN 200
80	0000	GOTO 60
90	0000	SES 4667,LO,DI,PEEK(900)=0 THEN PRINT "YOU CAN'T GO THAT WAY" GOTO 60
100	0000	SYS 4677,LO=PEEK(901) GOTO 40

# I.Q.

*If you hate throwing darts and feel that you need something more intellectual to stimulate your grey matter then look over this selection of games*

## ULTIMA I

**A** person who has not played the excellent Ultima III or even better Ultima IV will have wondered how it all started. Playing these games is like watching a film that already happens through time so you can find out how it all began in the non-linear version of the popular Ultima I.

There was once a land called Ansalor in a province called the Isle of Linn. In the land of Ansalor, there was also one of the most skilled Wizards who made all games yield to a wizard. He called the land with a name of his own—

Ultima. It is an old tradition of this land. As with any dragon, he needs a lot of his helpers, the Wizard and the Knight.

It is a heavy and aged, beloved name in the land of Ansalor. It is a name that is given to a man. As the game begins, the wizard and the knight are being rescued from a prison. The wizard is the one that decides what to do next. He is the one that decides whether to be a knight or a wizard. Once you have decided on what you are, you will go to the great outdoors and a number of things will happen. You will be given a choice of the game. Either one of these and the wizard will be going to the rooms of the building.

Inside towers and castles you can buy food and drink to keep you alive. A town to sleep in, repair and enhance your things, to buy equipment and weapons, to practice the game.

As in the subsequent Ultima games you move around with a set of spells. By pressing simple key commands that are detailed on a quick reference guide. This is supplied in the digital game box with the dark booklet of spells and magical colour maps of the world and a small log of notes.

Ultima I has been re-released and updated up for the second time and is a must for Ultima adventures. You may find it a little easy after III and IV but it's still a challenging game that will lead you to the world of Ansalor and more. Use it here to find out the rest yourself. Coming soon: Ultima II and then III.

111

## ALTERNATIVE REALITY

**I**n putting all your worst nightmares joined together and then making them real, that was the idea with this game in the Dungeon. Hidden somewhere beneath the City of Vabes, a Demon, without control in the middle of a large cathedral with a pulsating ground you can see various things enough to discover how you can lose the desired to your advantage!

The Dungeon is the second version of Databit's Alternative Reality series. It follows you from the City but you do not need to own this game in order to play. The story is that you have been kidnapped by an alien spacecraft. You find yourself in a room with only one exit which leads you to an alternate reality.

As you have the room a panel of quickly rotating numbers that you can use to enter various rooms and

I find so that it can be used and stored. That is simple enough for me, regardless, but because a nightmare where you have to fight to control all the real time. There is an optional mode sequence in which you act as a Spirit-warrior trying to shoot some evil, Mewmew-like.

There's Europe was the game that brought from and against the PSL. Set on the near future, it revolves an attack by the Eastern block against the combined forces of NATO. The scenario, was created by the fact that you have a nuclear strike capability, either limited or full scale. There are levels of progress from the non-warrior background and the people who thought that all airplanes covered by the (and ought to be based). As a result of their case, they are called the "pilot" mode.

Whether you play, it soon becomes apparent that among the tactics against it is to manage or to push (but both sides maintain everything a becomes positive world as we know it. That said, there is still enough in this game to keep you thinking. You must keep your troops supplied and your weapons focus to their best advantage and decide whether to use chemical weapons. All this on top of fighting a ground battle on a massive scale. There are some different air missions that you can fly ranging from reconnaissance to attacking enemy supply lines.

Each level offers five different levels of play. You must decide where on the island you are going to land your forces and three operations have a limited amount of time as the leader of the island of Argentina is forced. Use use of your SAS and SBS forces for reconnaissance purposes should help you here.

Each unit has attack and defense factors, a movement allowance and attacking range. For example, a battery cannot move very far each turn but can attack from long range, whereas the Paras have to be near to their opponents before attacking (perhaps it's better). After an attack, you may well depend on conditions to be able to maintain an attack or require naval gunfire to help you. There is a level, especially on the border level and the task of liberating all the settlements is to see, you separately as you don't know the disposal of the enemy forces.

All these games are very well presented and easy to control, being by and large menu driven. Whereas this lack the complexity of some fully blown wargames, they more than make up for it by being very easy to get into and retaining a high degree of playability. As such they are highly recommended to beginners and newcomers of this fascinating art.

#### STATIONFALL

**Y**ou clearly still haven't ditched the idea that you are used when you joined the Starliner Patrol some two years ago. You started off as Ensign, worked class, sweeping the decks of space ships. Then, by some stroke of fate, and then, then a little while on your part, you manage to see a planet. Promotion came, fast. You are, now, a lieutenant first-class but still the excitement promised in the glossy brochures when you joined the patrol is nowhere to be found.

Look at your present assignment. Stop over to some remote space station and pick up a supply of Request for Starliner Patrol leave Application (Black Form Request Form). Clearly, the staff of which legends are made, isn't. You are left up a bit when you go to pick up your request, so one of your three available choices is Floyd who wanted you to stay, where you are and finally (and also in Planetfall) he is delighted to see you a genuine hope to be picked. How could you refuse such an offer?

Completing the paperwork as quickly as possible (a replacement courtesy of the computer) in your spacecraft, and set back, and you arrive at the space station. You are a little surprised to find that there is no one there to greet you. As you explore, you quickly discover that the entire station is deserted. Even Pluto, another robot that Floyd makes friendly, with a surprised to see you but isn't too sure why.

Wandering around the station, the only clue that you find is a tape of the Captain's log which has entries about the arrival of a stranger ship speeding which seemed to be made with progressive series of industrial control every part of industrial equipment. Your worst fears are made real when you are attacked by a homonoid, kill your crew.

As is usual with Infocom games, the work is boringly method. It is impossible not to fall for Floyd, however that he is, as he, keeps up mostly behind you to about "two levels up your cut". The descriptions of locations and objects are wonderful and we've mentioned the art of gawking the planet "horrific impact" and showing them back in a similar way - quite like Infocom.

Then, perhaps, though, once the wonder of adventures, it's time to begin to look somewhat frustrated and the ship, especially when compared to the likes of Magenta, & such. For example, a phrase like "get the tape and a chance of" won't work as the parser demands that you are trying to get something called an "instrument".

Just to see any old content being disappointed, especially if this is just Planetfall. The package, which includes a voice patch, a set of blue print and some mission instruction booklets, and helps to create the atmosphere of yet another excellent Infocom adventure.

# Making Music

*The second installment of our music series continues coverage of the 64's sound chip, SID, and explains how to play tunes on your Commodore.*

*By Peter Gerrard*

**Y**ou will find in your Commodore 64 manual a list of high and low value frequencies for a number of notes. They're on page 162 if you've lost them? Here we are concerned with locations (V+H) and (V+L), which will contain the low and high order value frequency respectively.

For we want to play the note C-3. A glance at the table reveals that the high value frequency is 263, and the low value frequency is a 97. So, in order to play this note the final line of our program becomes

```
30 POKE V+0,97:POKE V+1,263
```

Obviously the V+6 could be abbreviated to just V if you wanted. To play any other note just alter the low and high value frequencies in line 30 (values between 0 and 255). To alter the waveform, alter the number in line 29 (remembering to alter the pulse width as well if you select a pulse waveform) choosing between 17, 51, 65 and 128. To alter the ADNR settings fiddle with the values in line 30 (values between 0 and 255), and to alter the volume just change the value in line 15 (values between 0 and 15 only, please for now).

When you're satisfied with crossing

a few simple notes or notes, we'll travel onwards and take a look at producing some harmony using all three voices.

## In Harmony

Producing notes with all three voices is not that much more difficult than producing notes with one. Having gone through the effort in the first section of setting up a simple note let us now take a look at some simple chord rules when operating with all three voices.

**Volume**

This information lets us do the same for all three voices, and if the control register is set to 13 then all three will be playing out three notes, a triad, on the volume waveform. However, by using different waveforms and playing notes from different octaves and using more, the effect of different volumes for the different notes. A low note played using a triangle waveform will sound much quieter than a high note played using a sawtooth waveform, for example.

**ADSR**

There can be different use for three voices, and it is usually a good idea to make use of that fact when playing notes in harmony. Harmonic intervals are probably heard to their best effect when notes are sustained for a reasonable length of time, rather than one would expect on an organ, and so in our program to follow we'll be doing precisely that. Attack and decay times however are probably best left up to the requirements of the individual notes.

Remembering that musical notation returns to notes as C D E F G A B and then back to C again, our octave further up of course!

To produce a simple chord of C, then we'll take the following high and low value frequencies:

Note	Low Value	High Value	Frequency
C	24	1	536
E	165	2	673
G	91	1	883

From that you can probably work out the relationship between frequency and high and low values. Multiply the high value by .796 from step 1 on only when number 1 and add the result to the low value. The given is the frequency value. So always frequency value times to work with? Well if we wanted to play our chord at a higher octave we the note above up the scale we would multiply the frequencies by 2 (this is the relationship between notes in different octaves). To go up another octave then we'd multiply the frequency by 2 again. It's a lot easier multiplying our

number by 2 than it is multiplying two numbers and trying to compensate a result from that!

So, having got the values for each, a look at our program, bearing in mind that we're going to be using all three voices and that the control register that look after each voice come in blocks of seven. That's if we use our variable  $V=14273$  we'll see that the waveform for voice one is controlled by register  $(V+8)$  for voice two by  $(V+17)$  or  $(V+11)$ .

**Waveforms**

Given more we can make use of the features available with the SID chip and use different waveforms for each of its voices. However, since these waveforms are not going to be an awful lot of that if we're going to be attempting to produce, various, pleasant sounding harmonies, so for the purpose of this exercise we'll stick to our triangle, sawtooth or pulse.

**Note Values**

From which all of these are worked out for you is the Commodore 64 manual and as well as giving you the high value and low value frequencies for each note over some octave octaves, they also give you the value of the note in cycles per second. This is related to the frequency values in some simple fashion, but it can be of more use to us especially when lengths, times or notes

more than by  $(V+17)$  or  $(V+11)$ . This enables us to set up a simple CHR NEXT loop to look after all three voices.

**The Program**

As before, we'll flush out the chips, SID chip controls first before we start by setting the variable  $V$  and turning the volume on.

```

V FOR I=8 TO 24:POKE 14273+I 0
NEXT I
V=14273
I5 FOR E=24 TO 15
POKE V+I 8
POKE V+I+8 POKE V+I+16 100
POKE V+I+12 POKE V+I+20 140
POKE V+I+16 POKE V+I+24 180

```

There is no great significance to any of these values, other than that we have used quite a long system and reference for each one. Now to set the waveforms.

```

25 FOR I=0 TO 2:POKE V+I+16 NEXT I
I8 POKE V+I+17 POKE V+I+11
I5 POKE V+I+8, 65
I7 POKE V+I+16 POKE V+I+17 255

```

The only difference here is that we're using different waveforms for all three, and that voice three is using the pulse waveform. Finally, we need to play the actual notes, like this:

```

30 POKE V+16:POKE V+12
I1 POKE V+16 POKE V+12
I2 POKE V+16:POKE V+17

```

The result is, hopefully, a pleasant sounding chord.

From here it is but a simple matter to play different chords in different keys. All you'll need to do is to look up the high and low values frequencies in the manual and remember that chords tend to go in pairs of two notes at a time. That is, when playing like C/E, G/A we've played notes or D/F. A for a chord of D, or G/D for a chord of G, and so on. You are welcome of course to experiment with dissonant

choice, if you can have such a thing, but remember that you might get on very well with your sightless at the moment and that I won't be responsible for any untoward results.

Being as usual the techniques used here I used in particular the use of a FOR...NEXT loop and the relationship between the three voices; it is but a simple step to go from notes and chords to proper tunes. There are many ways of extracting a tone from your Commodore 64 and in the next installment we'll take a look at some of the common methods.

## Playing Tunes

Using the material that we've covered so far, there is really only one thing further that you need to know in order to be able to play some tunes on your Commodore 64 — the notes we're going to play.

Later on we'll be using a modified synthesizer program to do all this for us, but for now we'll stick to some very simple things that most people will either know before typing or at recognize when played. Having got us far in using three voices we will continue to use them, and we may as well stick to the waveforms and ADNR envelope shapes that we've already set up. So our program begins like this:

```
1 FOR I=0 TO 24 POKe 04272+I*0
NEXT I
10 V=04272
12 POKe V+24 I3
20 POKe V+59 POKe V+6 240
21 POKe V+12 9 POKe V+15 240
22 POKe V+18 9 POKe V+20 36
23 FOR I=0 TO 2 POKe V+17+4*I
NEXT I
25 POKe V+16 12 POKe V+11 33
POKe V+16 63
27796 V+16 6 POKe V+17 250
```

So far so good and so far familiar. We want to carry on to include the three lines from the last section that actually played a chord, so'll consider what notes we're going to play first of all.

A few lines enough time to everybody used for the "three" used as Chord Encounters of the Third Kind when the three and humans finally establish some sort of communication

and produce a matter of sound and lighting effects that would do justice to an Electric Light Orchestra concert. The five all-important notes are D, E, C from our octave and from an octave further down we have C and G. The five notes are played in that order and since there also have more or less the same duration, we can concentrate on the notes for now and worry about the duration afterwards.

It really is about time to forget about high value and low value frequencies and to start concentrating on their frequency values or the number of cycles per second for each particular note. For the five notes in our Chord Encounters theme, the frequency values are as follows:

```
100 DATA 1284,1851,1402,596,
888
101 DATA -1
```

The -1 data element in line 101 will serve to tell the program that we've run out of data and are not going to be playing any more notes. If we add the following lines to our main program, we'll be able to produce a simple tune:

```
30 READ T IF T=-1 THEN FOR
I=0 TO 24 POKe V+14+I*0
NEXT I
41 F#=-INT(F/256)*FL-F+F#*256
42 FOR I=0 TO 2
43 POKe V+I*9 FL POKe
V+I*9+1 F#
44 NEXT I
40 GOTO 29
```

That, as you will soon realize, does not produce a very acceptable tune, and we do need to introduce some form of delay between going back to line 25 and getting the next note, a line something like line 33 would suffice for now:

```
33 FOR I=0 TO 800 NEXT I
```

A one second delay occurs between notes. But wouldn't it be better if we were to let the program produce the data for us, rather than just having a one second delay all the time? Here's just one way of doing that:

```
100 DATA
1284,591,90,1472,59,358,30
802,800
```

and assuming line 33 is read

```
33 READ DE FOR I=1 TO
DE*30 NEXT I
```

This gives us much more control over the duration of each of the notes but is still a long way from being really satisfactory. We can only achieve this through much trial and error, or reviewing the programming rules of things algorithm and trying the program running the program do the job. If we had our original line 100 back again which is

```
100 DATA (284,1851,1402,596,888)
```

we could insert yet another new line 33 to read:

```
33 GET A$ IF A$ < ">" THEN
33
```

In which case we would want for the person running the program to press the space bar before proceeding on to play the next note. However this is still using alot of the 64's manual capabilities, and in order to make each voice play the note in a different key we would have to make something like this:

```
31 F#=-INT(F/256)*FL-F+F#*256
32 FOR I=0 TO 2
33 POKe V+I*9 FL POKe
V+I*9+1 F#
34 NEXT I
```

3000

```
50 FOR I=0 TO
2 F=I*2+1 F#=-INT(F/256)*FL-F#
F#*256
33 REMARK is now redundant
39 POKe V+I*7 FL POKe
V+I*7+1 F#
34 NEXT I
```

Each note now plays its rest (1/4 or 1/2) exactly right, except the note frequency takes being determined by the statement  $F=F*2^{(I-1)/2}$  in line 11 now, there'll give a note value if it's the last note it plays the loop when I is equal to zero.  $F*2$  when I is equal to one and finally  $F*4$  when I is equal to two. Raising  $F$  to the power of 1/2 is a useful shortcut to producing the desired frequency.

But all that is concerned with producing simple notes after an arbitrary octave. How might we go about producing a three part harmony, still using our Chase Encounters data and so on? For this we have to try and understand the relationship between notes of equal name, a note we do not need to speed the rest of our days working out some numbers of different frequency values.

**Note to Note**

Well, it's a kind of interval that relates are separated by a frequency value of two. That is, if C is one octave less than the frequency of C in the next octave, a quarter that of C in the next octave again and so on. Unfortunately for us there isn't a constant number of notes from one C to the next since there is only a set of 12 notes between C's or seven notes (including the C itself) in total.

A simple but not entirely satisfactory solution would be to divide the difference between two octaves into twelve and use these values for our chords of D, E, C, C again and D for the Chase Encounters theme. Also, the 120:80:60 doesn't play it right so does not work as nicely. These little black notes have a habit of getting in the way.

Fortunately there is a mathematical expression for getting the frequency of the next semi octave scale provided 100. Know the frequency of the preceding note and it works like this. Assume that F is the frequency of the note, not yet converted into high and low values to be POKE'd into memory. Then if we simply divide  $\sqrt{2}$  by C, then the frequency of the note D is the same value is found by the expression

$$F \times \sqrt{2}^{(I-1)/2}$$

A more complicated but it does work! For example the frequency of a particular C in a particular octave is

given as 1001 cycles per second. Applying this to our formula above gives us the new frequency of 1001. Not exactly the value given in the manual (which is 1204) but close enough and those in the manual are never meant to be taken as gospel anyway.

So what more use the formula, and instead of spreading our three notes over different octaves we'll now get them playing in harmony by introducing the following changes to the program

```

13 FOR I=0 TO 2:IF I=0 THEN
F10=INT(F/120) F2=F
F10=255-GOPOKE
12 F=INT(F*2)^(2/12)*F10
33 POKE V+I*12-I, POKE
V+I*12+I*F
14 NEXT I
    
```

Now doesn't that look wonderfully complicated? It's quite simple, really don't you? On the first pass through the loop nothing unusual happens because we use a set the original value of the frequency. Second time around remembering that a chord of D will consist of the notes D, F, A we want to be two notes higher up. In other words replace the original 1001 by 1373 which tells it or not it what all the renaissance chords do. On the final pass through the loop we want the frequency of the note that is four notes up from our original D, but since we cannot have 1746 replaced by 1747 so we have to do everything as fractional of 12.

The main thing is that it works. Also a list of the variations are there that can be achieved by using just five data lines. By playing in different octaves or by producing chords we begin to get some idea of the power behind the 64. But this isn't of course, the only method of playing times on the machine, and so for the rest of this particular section we'll be taking a look at one or two other examples of using playing. After that, well, the light will be over and we turn to share in our attempts to get the most out of the 800 chip.

**Tuning up**

Here's the list of just two different methods of playing simple notes on the 64 Data data statements, without any preference at all, because you should be

getting familiar with the registers and their locations and functions by now. Play with them exploring them, because it is only by doing that that you'll truly begin to understand the workings of SID.

```

30 V=54012
33 POKE V+24:15
34 POKE V+5:9
40 POKE V+6
35 POKE V+2:255
63 POKE V+5:29
33 POKE V+6:65
80 READ A,B,C
90 IF A=1 THEN 200
95 POKE V+3:0
110 POKE V,C
120 FOR I=0 TO 4:IF I=0 THEN
130 FOR I=0 TO 2:POKE
V+I:0 NEXT
140 GOTO 20
150 DATA
5:22,32,5,25,32,1,17,16,21,24
160 DATA 1:2:22,1,25,177
170 DATA
5:28,214,5,28,214,5,30,141,19,28,214
180 DATA 2:22,177,7:22,227
190 DATA
5:25,177,5:20,227,4:21,194,10,23,
227,0:0
230 FOR I=0 TO 24:POKE
V+I:0 NEXT:END
    
```

One way of doing things you may (I hope) spot the 'four' being played which makes me think like Laurel. Now I suppose that that's the only similarity between us, I believe you!

For our final example here's a slightly different way of achieving the odd sound effect or two

```

10 V=54012
30 POKE V+24:15
33 POKE V+5:9 POKE
V+12:9 POKE V+15:255
40 POKE V+6:0 POKE
V+10:9 POKE V+20:70
45 POKE V+2:A POKE V+40:19
48 POKE V+2:20 POKE V+9:20
50 POKE V+4:65 POKE
V+41:19 POKE V+12:129
60 FOR I=0 TO 48:POKE
V+I:POKE V+I*POKE
V+I:1 NEXT I
70 A=+00IF A=0 THEN A=0
80 FOR I=0 TO 24:POKE
V+I:0 NEXT I
90 GOTO 30
95 FOR I=0 TO 24:POKE
54012+I:0 NEXT
    
```

From the RUM/STOP key to get out of this one, and then enter GOTO 95 to start over again, up.

There are many, weird and wonderful sound effects that can be achieved by "smacking" about with just the things that we've learnt about so far. To altering the various parameters on this and other programmes, to see what the effect might be.

When we start considering the more advanced techniques available to us on the 64 such as filtering ring modulation, over-modulation and such, we will be able to start producing even more wonderful effects, but we will also be on the path to producing a true synthesiser, involving the simulation of different musical instruments and much more besides. However before we can talk about musical instrumentation we need to know a great deal more about how various work and in particular how different instruments produce the sound that they do.

Consequently, in the next section we'll be looking in some detail at ADNR envelopes, and how changing them can produce a wide variety of different and unusual sounds and how combined with a selection of different waveforms and one or two other parameters we can really start to realise the potential of the 64 and its 32K chip.

#### Attack Decay Sustain Release

In order to estimate the quality of any musical performance that we might achieve by using the Commodore 64 a thorough understanding of the envelope stage of a sound, or the ADNR setting is essential. The simple definition that we have already given for the phrases Attack, Decay, Sustain and Release will tell us what they mean but will not explain precisely how they operate. Consider the following program:

```
10 V=34272
20 POKE V+8129
30 POKE V+438 POKE V+4 30
40 POKE V+987 POKE V+6 0
50 POKE V+1 30 POKE V 30
```

This produces a note of a certain frequency playing using the standard waveform, and having an Attack/Decay setting of zero combined with a Sustain/Release setting of zero. The note, as you will

have seen this sound by hearing "Release" it we hear less 40 to read.

```
40 POKE V=338 POKE V+6 0
```

Now the note does not immediately die away and indeed sounds rather different. A more substantial program should illustrate how the various settings of ADNR can be combined to produce some very different effects. Later on, we shall be looking at the workings of the two registers that control the notes envelope stage of the note (for voice use only, this work is made by the same way, for voices two and three).

```
10 V=34272
15 POKE V+8 TO 24 POKE
V+10 NEXT I
20 POKE V+3446
25 A=1 D=1 S=1 R=1 W=1
30 PRINT "CLR:"
35 PRINT "NAME:Attack Decay
Sustain Release W/Form"
40PRINTTAB(8,4)NINETOAB
UPPERAB(1)TAB(0)W*IN+6
41 POKE V+8 0
50 GOTO 45 IFAS=" THEN 60
55IFAS="A THENA=A+1 IFA=17
THENA=0
60IFA="D" THEND=D+1 IFD=17
THEND=0
65IFA="S" THENS=S+1 IFS=17
THNS=0
70IFA="R" THENR=R+1 IFR=17
THNR=0
75IFA="W" THENW=W+1 IFW=17
THENW=1
80 POKE V+5 A*16+D POKE
V+6 S*16+R
85 POKE V+4 0 POKE
V+4 W*16+1 POKE V+12 40 POKE
V+1 40
90 POKE V+129 POKE V+0 20
95 GOTO 15
```

A fairly straightforward program, but it illustrates the point. After setting up the variable V the program then displays the current settings of Attack, Decay, Sustain and Release on the screen before waiting for the user to press a key. Pressing the "A" key increases the attack setting, D the decay setting, S the sustain setting and R the release setting. Finally, pressing W changes the waveform should you choose to do so.

The ADNR settings are FORKed into place on line 85, before line 87 takes care of the waveform (and sets a low pulse frequency and a high pulse frequency if required) before the note itself is at last played by line 90.

You might care to add to the program so that different pulse frequencies can be selected or different waveforms played. The changes are not too difficult and once we've taken the precaution of having our line numbers increase in steps of 100 there's plenty of room for additional comments to be inserted if required. These will probably be along the lines of "IF AS="something or other" THEN increase some variable. Not perhaps, the most elegant way of programming, but it will suffice for the simple example.

Now for a few words of explanation. You'll see that the waveforms are set to values of 1, 2, 4 or 8. It's multiplying them by 16 and adding 1 so as to get more reasonable values of 17, 33, 65 and 129.

You will note that the various ADNR settings cover programs beyond 15. This is because the two control registers that look after these settings are obviously shared between one and operate in that fashion.

```
A A A A D D D D
S S S S R R R R
129 104 102 016 068 104 102 001
008 004 082 061 065 104 102 001
```

In each case, the first four bits of each byte are used to control one setting, the second four bits for the other settings. To look at the Attack/Decay register for now, note the Sustain/Release one works in exactly the same way, so we'll see that the maximum value of the Decay setting is actually 15, coming from the addition of  $(16+4+2+1)$ . Given possible settings then, here's 0 through to 15.

It might appear that the value of the Attack can vary from 0 to  $(128+64+32+16)+255$  covering such values as 64, 192, etc., or the way. However, adding all these combinations up gives us 512,000 different settings or settings if you include zero options. How much more it is to think of settings ranging from 0 to 512,000 (rather than 0 to 255) and obtain points intermediate and then multiply the final result by 16 to arrive at the higher value. If you think all the

possibilities, though you'll soon see that this much easier system works very well.

It is important to understand this principle because we will be using a system which we come to know of the other main-purpose (not just dual-refer) registers in the sections on ring modulation, synchronization and clearing.

Just think in terms of bits and bytes and remember: *display* always have a byte in made up on an 8-bit computer.

Having listed what the ADDR strings do, you might be wondering how to go about converting these strings into possible instruments. Well, the Commodore 64 manual gives us some hints such as:

**Instrument Impoverishment**

Instrument	Waveform	Attack/Decay	Sustain/Release	Pulse Rate
Piano	Pulse	0	0	High Lo+285
Harpsichord	Sawtooth	0	0	-
Accordion	Triangle	002	0	-

Do these sound like the real deal? If you use the values in our little program given earlier! About as much as I would like Frank Sinatra which is not set below me. No, there is a lot more to experimenting musical instruments than just fiddling about with ADDR settings although they are obviously important.

As a starting point, though they will have to suffice and although we'll be taking a few more steps in the next couple of sections try for now to think about the sound produced by the

instruments developed above. A piano for instance produces a very sharp note, which is sustained for a while, and then usually decays away quite slowly. How would you go about writing up the ADDR settings for something like that?

Well, as in these cases it is not clear to me what something like that is to try and describe it in the following program should be of some help when it comes to thinking up suitable ADDR settings.

75

# WIN A FREE FLIGHT ON CONCORDE

The creators of B24, a superb combat and flight simulator based on one of World War II's most important aircraft are offering the world in a limited opportunity for you to win a free trip and, incidentally, the world's most famous aircraft.

By answering the simple questions below you could win a dream trip on the world's most advanced passenger aircraft flying at speeds faster than the speed of sound.

#### CONCORDE: THE FACTS

- Concorde flew on 2 March, 1976.
- Concorde has carried over 100,000 passengers over 30 million miles.
- Concorde holds the record for the fastest passenger flight London to New York in 2 hours 53 minutes on 1 January, 1976.
- Concorde's maximum level speed is 1,357 mph.
- Concorde carries a payload of 120 passengers.

If you are not a lucky winner in this great competition, don't worry because you can still experience the thrill of flying plus the exhilaration of combat in B24.

#### B24

Provide another piece of World War II nostalgia and legendary airframe expertise in this 80-minute, 1-hour game simulation allows you to recreate the exploits of the great airplane on single missions. Run way 15 minutes complete to display of references in Paris, France.

As pilot, you control the mission flight and a landing roll from your cockpit seat in flight, as a group leader you coordinate flight and formations to specific strategy and orders and adjust to levels depending upon weather, plus visibility, group efficiency and target oil production levels. A flight and combat simulation supported by tapes.

Available on  
**CBM64/128**  
TAPE £14.99 DISK £19.99

U.K. Catalog Order by mail from New Zealand  
Dunblair 01 444 341 300 300 300

#### THE PRIZES

1st Prize: Two tickets for a flight on Concorde plus a copy of B24 and an M1 Order of Merit Flag.

50 Runners Up Prizes: A copy of the superb flight and combat simulator B24.

Please make a preference as to Tape or Disk

#### HOW TO ENTER

Go well to experience flight on Concorde across the following New Zealand and overseas mail (NZD) flight offers would win you want to fly faster than the speed of sound in the comfort of a jet, the most original means will win the first prize.

Prize card return to:

41 Gully Road  
North 17 Auckland New Zealand Dunblair 01 444

1. What is the speed of sound today?
2. Name three World War II aircraft.
3. What are the initials USAF stand for?
4. What is a jet?
5. Do you know three flight words would start by letter that the speed of sound?

#### QUESTIONS

1. The speed of sound today is 340 m/s.  
2. Name three World War II aircraft: B-24, B-29, B-52.  
3. The initials USAF stand for United States Air Force.  
4. A jet is a type of aircraft that uses a jet engine.  
5. Three flight words would start by letter that the speed of sound: Jet, Jet, Jet.  
6. The prize card return to: 41 Gully Road, North 17 Auckland, New Zealand.  
7. The prize card return to: 41 Gully Road, North 17 Auckland, New Zealand.  
8. The prize card return to: 41 Gully Road, North 17 Auckland, New Zealand.  
9. The prize card return to: 41 Gully Road, North 17 Auckland, New Zealand.  
10. The prize card return to: 41 Gully Road, North 17 Auckland, New Zealand.

# Link Up

*Here is the chance to link up a short-wave technical receiver and Commodore 64 to a Transceive interface and multimode receive program.*

*By Evelyn MWH*

**B**ut do you still like the idea of short-wave reception? It's a little hard to believe, but there have been some reports that the market is quiet here with models ranging in price from \$25 to \$400. Regrettably, the lower priced models will not function with microchips/software of this type, so unless you're into the digital area.

Your shortwave receiver should cover the range 1.8-20 MHz and it must have a detector to ensure SSB signals, sideband plus a CW filter for picking up Morse. To tune to an exact frequency, a receiver with digital display is worth more, so watch.

## Price Range

Having said all this, how much do you have to pay for such a model? Looking around a second hand market would be informative as there is a constant supply and demand. One household model is a RAISEI FSL7080 which costs around £250. Second hand offers are rare, but short-wave listening is a hobby, so you'll find which users put a great deal of maintenance and pleasure into it.

An acceptable receiver will set you back a minimum of £150 second hand and should have all the above features including the facilities to use a good aerial and earth. The receiver must have worked on a long wave or some 40 metres) variable, provided it has a back up coil wire.

## On to Computing

The essential which is small and

compact, plus into the rear part of the CW and is connected to the audio output on the short wave receiver (aerial and connectors are supplied). It has a single switch which controls three functions: one position sets the computer for CW reception, another for RTTY reception and the third for SSB reception. According to the data you wish to receive, set the switch accordingly and load the disk RW-4 program.

While the program itself is small, it is extremely compact and efficient in use. All of the computer functions via a single key press, a list of which is given in the literature supplied. On loading a status line will display at the bottom of the screen. Press F and the indicator that you are in RTTY (a keypad mode) is C, press C you'll be more, reception on A, press A you'll be RTTY reception and T press to download SSTY (short wave screen television screen). The RTTY mode will not be described here as it is similar to RTTY.

Our main options are F, R and C (aerial and earth connections wire, received and translated with non-volatile facility, list up into the C option too).

So do this set the station, switch to CW, then tune into the amateur bands available for receive transmission using the U, W option on your monitor. These bands are listed in most short-wave handbooks and the most successful ones found to be the 14.3 (20MHz) and 14.0-14.19 (MHz) bands. The software controlling reception has a filter selection of 700

Hz. 1500 Hz plus a filter 4000 Hz, these are displayed at the bottom of the screen and are selected with single computer keys. There are also single key controls for setting word speed. For amateur rates 20 w.p.m. or 40 w.p.m. should be used (depending on the speed of transmission). A speed setting capable of handling up to 290 w.p.m. is also available.

Later options that you have based on a good short wave transmission. At the top left hand corner of the screen, reading is visible, with frequency prefix at which point a flashing yellow cursor will appear and the more transmission will now be translated to text on your screen in English or the appropriate language—such conversations are regarded as confidential and may not be printed here! You will find the transmission call-ups printed out continually, enabling you to locate better geographical position (with reference to handbook).

It should be remembered that many people use Morse in an abbreviated form or even in coded form. Furthermore you are just as likely to catch the end of a conversation as the beginning before what you pick up is a matter of trial and error and chance. The transmission may be broken or interrupted, it may be.

During reception, when one word is full it is necessary for subsequent data which allows fast decoding. All material can be saved to disk by pressing—(a beeped by headset) should be followed by a single number

# Sprite Grabber

*Want to use sprites from other programmes in your own games? This utility makes it easy for you to find and save them for later use*

*By J. MacDonald*

**S**prite Grabber is a useful utility for examining the sprites used in games. The sprites once found can be **SAVED** to disk or tape, **LOADED** back into some form of sprite editor and changed at will. In this way you can build up a library of your favourite sprites from your favourite programs.

## Getting it in

Sprite Grabber is a machine code program (presented here as two Basic Loaders). These should be typed in using the **SYNTEX CHECKER** program that can be found on the **LISTINGS** page.

Why two versions of the program? It is simply that they are both located at different addresses, in case one happens to sit at the same area of memory as the sprites you want to grab.

When the loaders have been **RUN** I suggest that you **SAVE** the machine code using a monitor or one of the following small Basic programs. For the screens at address 49132:

```
30 POKE 45,0:POKE 44,101
```

```
30 POKE 45,100:POKE 44,50
```

```
For the version at address 10168:
```

```
30 POKE 45,9:POKE 44,4
```

```
30 POKE 45,78:POKE 44,64
```

Then **SAVE** the programs with

```
SAVE "SPRITE GRABBER" $\backslash$ X, $\backslash$ 
where X is 1 if using tape or 0 if using disk
```

The programs should be **LOADED** back to the address from where they were **SAVED** to, as usual, excepting any sprite data that may sit at the Basic area. You do this with the following command:

```
LOAD "SPRITE GRABBER" $\backslash$ X, $\backslash$ 
where X is as before
```

## Using the program

**LOAD** in the game with the sprites that you wish to examine. Once **LOADED** and **RUNNING** near the computer using a track branch, or a carriage with a reset, or a **LOAD** the **SPRITE GRABBER** program into memory at the address of your choice (49132 or 10168) and run the program with

```
SYS start address
```

where the start address is either 49132 or 10168 depending on the screen of the program that you choose to use.

A menu will now appear on the screen showing what the function keys, **Y**, **X** and **S** options and sprite information at the bottom.

The function keys will allow the sprite pointer to be increased or decreased by one, sprite colour to be

changed, toggling between multicolour and two-colour and toggling the XY expansion of the sprite **BANK** (switching is achieved by pressing numeric keypad 1 as shown on the screen). At all times the sprite pointer **BANK** and sprite address is displayed on the screen.

If you find a series of sprites that you like, which might be a composition, hit a track walking, use **F1** to display the first sprite in the series, and then press **F1** to save the sprite pointer. Now use **F1** to move the sprite pointer to the last sprite you want to save, and press **F1** again to indicate the end of the series. Pressing **S** will now activate the **SAVE** version of the program. This will prompt you for Tape or Disk — press the appropriate letter and you will be asked for a filename (36 characters max). Your series of sprites will now be **SAVED**.

If you try to **SAVE** from a high to a low address, you will be notified of an error — press any key to try again.

Sprites can be **SAVED** from anywhere in memory, including under the **ROMs**. So remember, unless you are loading the sprites from a program, which will redirect them to a new address, they will **LOAD** into the area they originally came from — with possibly unfortunate results.

## PROGRAM GRABBER 10168

# Hook-Ups

Continuing our series, we look at the possibilities of using the BBC as an intelligent disk drive interface between the C64 and itself.

*By Mycroft Appleby*

Last month I explained the general principles of parallel communications, the technology and the method that I was going to use in the series. Also I included as an example a simple memory transfer program for the C64 and BBC micro.

This month I'll look, at a more practical application of the system, if there are two things that are different in the C64 and BBC. Micro is assigned and most specifically disk speed. The BBC Micro has one of the fastest and cheapest disk systems on any home main. The Commodore 64 on the other hand does a lot of disk drives at one GB, they may look like disk drives, but in reality they are faster because inside that disk drive shaped box, they have to do the information coming down the serial bus and search it as the surface of the disk is searched.

This kind of format is very slow and was based specifically by Commodore for the task. One of the strangest things about this kind of format (Random Access) is that they use as the paper envelopes, that disks usually come in. If you don't believe me, count the number of disks that you can get there count the number of envelopes — see! Further proof is evident when you swap data in the middle of a 'read or write' operation. The message happens because on the roof of the box to get you to stop.

So with these two things combined it should be possible to use the BBC Micro as an intelligent disk drive, interface between the C64 and the BBC Disk Drive. All you need a some clever software and the appropriate transmission protocol.

There is a small basic program in the C64 and the same program on the BBC Micro. This is for two main reasons. Firstly you can load 1K of data into a BBC Micro and then put it onto a C64 to fix basic problems that

you get with Basic, getting confused with machine code. The second reason is that this series isn't designed to get complete solutions to problems, but rather to supply the tools and the information to do the job. For this the code must be in Assembly format rather than some of the programs that you can see how it works. Most C64 assemblies are interchangeable with each other and interface with the system to such a degree that once the assembler has taken a chunk out of the memory map and writes all over the position you have to make where you are.

As the program is in the standard BBC format assembler. The C64 boot program is only slightly different from the one published last month, only buttons and accounts have been changed. Some of the code on the BBC, may not also be familiar as I used many of the protocols which were discussed last month.

## Starting Up

To load the software into both machines, first load "Basic" into the Commodore 64 and load "Disk" into the BBC Micro. Run "Basic" and then run "Disk". After about 35 seconds the code will have assembled into the BBC, been transferred to the C64 and then the BBC code will have been re-assembled and re-loaded for the BBC.

On the BBC screen at this point you will see a message indicating the buffer was ready to receive. This is the number of bytes in the buffer and indicates the maximum program size you can load or save plus 256 bytes for the header packet (which I've explained later). Do not exceed this. To increase the buffer size most of the error checking has been removed.

On the C64 side you should have returned to the Ready prompt.

Typing "515 4915" at the time mentioned was, will transfer the system.

At this point the micro reads the machine that handles the loading and saving will have been slightly altered. Tape and disk (if appropriate) will work as normal, as will all other device addresses except 'F'. This will transfer your program onto the BBC's (normal) virtual drive on the blank of an eye. Likewise loading with a device number of 'F' will load from the disk into memory as normal. (Loading is not possible however due to the 'data transmission device' the data goes back and forth in one great chunk, and it is difficult to compare it to a 'bite for bite' basis.)

## Alterations

If you have a disk drive already attached and want to use it also, then you can change the device number of the BBC very simply in the sectors "BLDISK" and "BSAIF" in the C64. All of the program you will see that the memory location "device" is compared to "BSIF". This is the device number. Change this to whatever number you want above three (that means above our three) and you are there. A good choice (and one I use myself) is seven as not a great deal stress on use the device number.

## How it works

Remember how last month in the header packet of the transmitted data as well as where to end how long the packet also had a byte called 'read'. Well, this is the command byte in the new system when the data comes flowing into the BBC, it looks at the byte and if it is a control known to save the data. The first 256 bytes of the data is special and holds various

information about the data, including the name it was to be stored under. This is extracted and the data is saved.

If the card number is zero, then this is a load request. In this case only the 256 byte header packet is sent, complete with message information about the program, as well as all data again. The C64 then puts this there and waits for the program to do what it returns to Basic, but you will have to program tell Basic control right away and the program just appears on every screen you study. This means you will not need a lot of care to operate it.

'Hoop' is the area to watch. Change the flashing off to operate in the (RC) loop and perform a manual refresh and you are done - parallel processing at last.

However, back to the plot. When the BBC has loaded the program on disk, it puts it on paper with a card of time and sends it to the C64. The C64 knows that these cards 'incoming program data and opens it accordingly.

A card of zero will force a primary dump as my daughter just follow the instructions for last month that it means for swapping words and messages or changing character codes character set.

**Protocols**

The transfer packet looks like this data to / Address when data is going to to / Length of data

and Command Byte  
The program packet starts 256 bytes ( looks like this

Header	Byte	Message
0	dir	File, binary address
1	dir	Character data (ASCII)
2-5	dir	Message
6-7	dir	File name address of program
8-11	dir	File and address of program
12-15	dir	Reserved for future expansion

**Next Time**

I hope this system is of some use. I will study on because there are more the BBC drive is so much better than available. I'll see what else I can do on it.

**PROGRAM: DISK**

# Rebound

*A superb breakout style game for C16 and Plus/4 owners*

*By K.M. Lawrence*

**I**t's funny how the old favourites like space invaders and breakout are still extremely popular with computer owners.

To play the game LOAD the program 'REBOUND' and RUN it. This will automatically LOAD and RUN the machine code version of the program.

Use a joystick, or port one to move your ball and hold down the fire button to make the ball move faster. But be careful - you have limited power to do this.

When you hit a brick it may turn into a mine and flash. From the state the brick may start to descend or it may change into a brick that will affect your ball in strange ways. The possibilities are small but we now consist of fast ball. The later levels award you for the ball spent while the others live for a certain length of time.

It is possible that when you hit a brick, a mine may fall towards you. If you catch this you get the chance of using one of the 4 mine options that will appear on the right of the

screen. Pull the joystick down to show the option that you want but remember the mine does that you control the better the option that is given to you.

## Options Available

- Power - Extra power to go fast
- Cart - Drop out of world that you
- Dot - Go to next level
- BALL - Up to slow ball on screen  
push up to release
- KLIFE - Up to 255
- Wall - Place a wall behind you so that  
balls will not be lost

When the game starts the screens are set to random order. Press RETURN while on the title screen to play the screens in sequence.

## Getting it all in

Rebound consists of two programmes. The first, REBOUND, is an Amos and should be typed into your machine in the normal way and then SAVE'd to disk or cassette.

The second program, REBOUND.MC, needs to be entered through the computer's built monitor. To enter the monitor type MONITOR type M 1000 to start loading the program. You will now be able to enter each line of the listing over the existing contents of the computer. You must press RETURN to enter each line of machine code. If you

have chosen not to MONITOR load the relevant sequence in your computer's manual and be able then you understand what you're doing before entering the program.

It is important to note that your typing must be very accurate. The slightest typing error will cause the program not to work.

When you have entered all of the REBOUND.MC program you should SAVE it to disk or tape by using the following command:

```
S-REBOUND.MC"/D1 0000/000
```

If using disk, change the (D) to (D). Comments within should SAVE REBOUND.MC after the program.

# Hide-It

Keep putting your own programs with the hands!

ASCII

By James R. Strong

**H**ide-It will allow you to protect any Basic programs that you have produced. It allows you to ensure that when it is loaded, only a single line will be shown and this will only contain a SYS number.

Of course, Hide-It isn't going to keep a determined hacker from looking into your programs. It will however, do the casual or stupid hacker leaving them.

All of the instructions are printed by the Basic loader program, so you should have no problems using the program.

The machine code version of the program is also reproduced here for

anyone who wishes to understand the code. The assembler used to produce the listing is *ASSEMBLER* which I have

mentioned in using as a standard for all of its machine code listings.

JD

## Getting it all in

You should have no problems entering the Basic loader. The SYNTAX CHECKER program found on the LISTINGS page of this magazine will help check your entry.

As mentioned the machine code version of the program has been produced using *Fast Commodore's*

own *SPEEDY ASSEMBLER*. You should be able to enter this code and assembler with very few changes.

As I have said, you will need to get into the Basic loader to use the program. The machine code is reproduced here for those who want to see how the program works.

### PROGRAM: HIDE-IT

# Software for Sale

*If you think that one of our programmes looks very interesting, but you can't afford the time to type it in then our software service will help you out*

**L**ike these a'clock in the morning. You sit at the computer keyboard just finished a marathon typing session moving one of the superb programmes from Your Commodore. Your fingers reach for the keyboard and press the letters E, V and M. You press RETURN, all black and nothing happens.

Everyone has probably faced this problem. When it does happen it's a matter of spending hours searching through the program for any typing mistakes. No matter how long you look or how many people help you, you can usually guarantee that at least one little bug slips through unnoticed.

The Your Commodore Software Service makes available all of the programmes from each issue on both cassette and disk at a price of \$6.00 for disk and \$4.00 for cassette. None of the documentation for the programmes is supplied with the software since it is all available in the relevant magazine. Should you not have the magazine then book orders are available from the following address:

INFONET LTD, 5 River Park Estate, Berkhamsted,  
Herts HX4 1HL  
TEL (0447) 768174

please contact the address for prices and availability

## The Disk

Programmes on the disk will also be supplied as totally working versions, i.e. where possible we will not use Basic. Letters then making use of the programmes reach easier. Unfortunately at the moment we cannot duplicate C16 and Plus/4 cassettes. However programmes for these machines will be available on the disk.

What programmes are available?

At the top of each article you will find a strip containing the article type. C16 Program etc. So that you can see which programmes are available on which format you will also find a couple of symbols after the strip. The symbols have the following meaning:

This symbol means that the program is available on cassette

These programs are available on disk

## Phase Note

Since the programs supplied on cassette are total working versions of the program, we do not put disk-only programmes on tape. There is no sense in placing a program that expects to be reading from disk on to tape. 93

## MAY 1987

**LOWER CASE GRAPHICS** - Using lower case text on your C16 and Plus/4 graphics screen. (On disk only)

**C16 CHARACTER EDITOR** - A powerful character editor for the C16 and Plus/4. (On disk only)

**KEYMAN'S GUIDE TO GRAPHICS** - All of the programmes from the fascinating article **CHARTRITE EDITOR** - A comprehensive sprite editor for the C64. Available for both disk and tape.

**CRIBET 66** - A character editor with no fewer than 44 different commands. (Available for tape and disk.)

## ORDER CODE

**DISK YEMASRP 66 66 TAPE YEMASRT 66 66**

## JUNE 1987

**DIAL PROGRAMMING** Have two programmes in your Plus/4's memory at once. (On disk only.)

**EMULATOR 64** - Make your single floppy for the C64 SMART LISTER - Make your floppy smarter and easier with this program. (C16)

**PROCEDURES** - Teach programming for the Commodore's program

**RESOURCE GENERATOR** - A powerful disassembler for the C16.

**LIST ENHANCER** - Improve the LIST command of your C64.

**ANALYSER** - A machine code debugger for the C16.

## ORDER CODE

**DISK YDUNES 66 66**

**TAPE YDUNET 66 66**

## SEP 1987

**UTILITY COMMANDER** - This provides state-of-the-art commands moving files. (On disk only)

**PLUS/4 AND C64 CRUNCHER** - Speed up your programmes with these handy utilities.

**PROGRAMMABLE FUNCTION KEYS** — A utility to make most, if not all, the function keys on the C64.  
**DISKET 4** — A handy routine to convert memory to data statements on the C64 (Disk only).  
**ARC/IDE ACTION** — Get those sprites with these handy arcade routines on the C64.  
**CRIBS& REFERENCES** — This program helps you sort out your variables on the C64.  
**SLICED BUN** — A fast and visualising game for the C64.

**ORDER CODE**  
 DISK YD4UGAT 04 00  
 TAPE YC4UGAT 04 00

**AUGUST 1987**

**DISKET 6** — Find the eeper for disk users (C64 - disk only).  
**SCREEN MAKER** — Design text and low-res graphic screens with ease (C64).  
**SCREEN DUMP** — A Hi-Res screen dump for the C64 plus MPE800 printer.  
**NUMBERS BASE TUTOR** — A C64 educational program helping with numbers bases other than 10.  
**Clé 'SPRITE** — Does your C64 lock something? Then add sprites with this useful utility. For C64 and Plus/4, available on disk only.  
**WINDOWS** — A true window system for the C64.

**Order Codes**  
 DISK YD4UGAT 04 00  
 TAPE YC4UGAT 04 00

**SEPTEMBER 1987**

**DISKET 7** — Copy your disk programmes to turbo tape with ease (C64 - disk only).  
**PLUS/4 ANIMATED GRAPHICS** — High-Res Animations for Plus/4 owners (Disk only).  
**SMOOTH VERTICAL SCROLLER** — Professional looking for video memory (C64).

**ORDER CODE**

# Tech Troubles

*If you have any technical problems, write to our agony uncle, Tim Arner who will do his best to help*

*By Tim Arner*

## Dear Tim,

I have a Commodore 128 and 1271 disk drive. After what I've heard recently, you have told me to go the back of the disk, especially with programs like Superbase?  
 Keyword: Noth, Blankout.

## Hi Raymond

The PET has certainly received a fair share of criticism over the past few months. In essence, the problem with it is that under certain circumstances, files that use the second side of the disk can become trashed. This trashing will ONLY occur under the following specific conditions:

Enter one RELATIVE file and one SEQUENTIAL file is open or those SEQUENTIAL files are open. Of course, one of these files must be on side 1 of

What happens to your newly opened file is determined by what the "WRT" flag on the header has been written to the file. In essence, if they WILL, never. The resulting file will contain only up to seven blocks of data regardless of how much was written. If you then COLLECT (trashed the disk, the block count no longer adds up to 128.

ICPUO member Greg Perry took Australia residents provided the following program which demonstrates the problem:

```
PROGRAM 1271.DSK.DSK
```

```
100 GET *** INFO OF 1271.DSK ***
110 GET *** CREATE RELATIVE FILE
120 FILE SIDE 1 ***
130 COPYFILE, OVER FILE: 1271.DSK
140 END
```

```
150 PRINT PLEASE WAIT - CREATING
  A RELATIVE FILE
160 GET FOR SEVERAL MIN MIN RELATIVE
  A RECORD
170 PRINT, "END RECORD"
180 GET *** OVER SEVERAL RECORDS
  A FILE ***
190 GET 25-1 TO 25
200 PRINT RELATIVE RECORD # 25
210 NORMAL END FOR POSITIONING RECORD
  C
220 PRINT, "THIS IS RECORD # 25"
  A
230 WAIT 60 SECONDS
240 GET *** DEMONSTRATION OF END
  OF ***
250 APPROX 1000 FILE SIZE (1/2)
  A
260 IF 20-20 THEN RELATIVE RECORDS
  "END" OVER THE INFO END
270 COPYFILE, OVER FILE
280 GET 25-1 TO 25
290 PRINT RELATIVE RECORD # 25
300 NORMAL END FOR POSITIONING RECORD
  C
310 GET *** READ SEVERAL FILE A
  NO WRITE TO END FILE ***
320 COPYFILE AS RELATIVE
330 PRINT, "THIS IS A COPY OF A
  RECORD # 25, "
  A
340 WAIT 60 SECONDS
350 GET *** OVER SEVERAL RECORDS
  TO A CREATING ***
360 COPYFILE OVER FILE SIDE 2
370 GET 25-20 UNTIL 20-20 2-2-2
380 COPYFILE AS PRINT 1.00
390 LOOP RECORDS END
400 GET *** POSITION RELATIVE FILE
  END ***
410 COPYFILE OVER (OVER THE
  END RECORDS, OVER)
420 GET *** CHECK OVER RECORD ***
430 IF 20-20 ON 20-20 THEN RECORD
  B
440 PRINT "DISK TRASH" END
450 END OF
```

Run the program on a newly formatted disk. A relative file is set up, filling all of side one and part of side two. The last 40 records are then written to demonstrate the bug so open a SEQUENTIAL file and copy the contents of the first 40 records into it. The resulting file is correct. You will see that most of the information was copied or missing. If you COPY "BASIC FILE SIDE 2" TO "AND

THIS" you will see something curious - the file is now only two blocks long!

This problem will occur with Superbase, and any other application that has more than one file open at once. Program loading and saving is perfectly alright, as there is only one file open. Keeping to one side is also perfectly safe.

There are new ROMs on the way, but they have been held up by the release of the new 128D Commodore should be able to supply them "not about now (?) so if it doesn't locate them. The cost is yet to be announced.

## Dear Tim,

I own an old 4001 PET and 4001 disk drive. I recently bought a Plus 4 and 1541 disk drive. My problem is that I'm using a program on the PET (downloaded on the Plus 4) but it won't load on the Plus 4. I can't load it back on the PET.

Can you help me?  
 James McInerney, Aberdeen

## Hi James

The reason for this is that the LOAD command behaves slightly differently on the PET compared with the later Commodore computers. On the Plus 4 (or C64 C128 etc) when you type LOAD "ANY PROG" if the program is loaded into memory, starting at a place known as the "start of basic". This is the place where basic programmes are stored, and it varies from machine to machine. For instance on the PET it is \$0800 on the 64 or \$0800 on the 128-DISK and on the Plus 4 it is \$0800.

Addresses on the 128 and Plus 4

# Listings

Get it right first time with our deluxe program system  
for the C64

**Y**ou may have noticed that our listings are free of those horrible little black blinks which send you scrambling around the keyboard for a suitable graphic symbol. You may also have noticed the funny numbers to the side of each line of the listing. From now on, it's all part of our new entry set.

Instead of those many graphics and rows of constant spaces in PRINT statements and strings, we use a special coding system. The code, or mnemonic, is always contained in square brackets and you'll soon learn to decipher their meanings.

For example [BA] would mean type in a Shifted A, or an ace of spades in levitation's terms, and [BAAB] would mean a row of ten of these symbols.

[B+] means hold down the shift key and press the plus key twice. It doesn't take a great leap of logic to realize that [C+] means merely the same thing except that the Commodore key (bottom left of the keyboard) is held down instead of the shift key.

If more than two spaces appear on a statement then this will be printed as [SP04] or, equivalently, [SP04]. Translated into English this means press the spacebar four times or to the latter case hold the shift key down while you do it.

A string of special characters could appear as [CTRL N, DOWNLEFT, BLUE, P+C].

This would be achieved by holding

down the CTRL key or you press N press the cursor key down three, the cursor left key five times, press the key marked BLUE while holding down the CTRL key, press the P key and, finally hold the Commodore key down while pressing the number to skip—[C2] would of course make the computer print in hexad.

Always remember that you should only have a row of graphics characters on your screen with no spaces/brackets and no mnemonics, unless something like this appears: [88] [C+].

In this case the two characters should have a space between them.

On rare occasions [REV T] will appear as a listing. This is a delta symbol and is created by entering the line up to the mnemonic. Then type a closing quotation mark (SHIFT Q) and delete it. This gets the computer out of quote mode. Hold down CTRL and press the smaller data key (WILSON), type the colon and number of inverted Ts and then hold down CTRL and press zero (WYSOFF). Next type another quotation mark and delete it again. Now finish the line and press RETURN.

A lot of these special codes is given in the table but remember that only one of these mnemonics will appear inside of a PRINT string, the symbol for p. This may appear when its value is needed in a calculation so that you look something like

00=0\*(P/P).

Ignore the square brackets and just type in a shifted upward pointing arrow (i.e. the p symbol).

## Checksum Program

The hexadecimal numbers appearing in a column to the left of the listing should not be typed in with the program. These are merely checksum values and are there to help you get each line right. Don't worry if you don't understand the hexadecimal system, as long as you can compare two characters on the screen with the corresponding two characters in the magazine you can use our last checking program.

Type in the Checksum Program, make sure that you've not made any mistakes and save it to tape or disk

immediately because it will be used with most of the present and future listings appearing in *Your Commodore*.

At the start of each programming session, load Checksum and run it. The screen will now be filled with values (characters) and each time you type in a line and press the RETURN key a number will appear on the screen in what this should be the same as the corresponding value in the magazine.

If the two values don't relate to one another you have not copied the line exactly as printed so go back and check each character carefully. When you find the error simply correct it and

press RETURN again.

If you want to turn off the checker simply type STOPPED and the screen will return to the familiar blue screen. You can then do whatever it is that you wanted to do and if this doesn't see the area where Checksum but you can go back to it with the same STOP command.

No system is foolproof but the chances of two errors cancelling one another out are so remote that we believe our listings are more reliable than any other magazine in the world. So get a copy!

## CH Spots

There are no problems with this program as printed. A number of people have queried how they should alter the [204] statements that appear in some of the lines of the DEMO program. When our printer sent a copy of a Commodore graphic editor a message such as [LEFT] is printed on the side of the character is printed within square brackets. In this case the character should be looked up in your manual and entered in the case of the [205] the character that should be entered is the P) Space ( )

## Software for Sale Important Notice

A number of people have reported an error when LOADING programs that have been SAVED using the TEC DRAW program.

It appears that a master copy became corrupted and has caused these problems.

Should your copy of the program suffer from this problem please return your disk to:

OMEGA MICRO SERVICES  
7 GRAHAM AVENUE  
BRINSFORTH  
BOTHAMPTON  
S80 5LA

and a new disk will be sent by return post. Sorry for any inconvenience caused.

Apologies are also due to people who experienced delays with software ordered in late January/early Feb. Unfortunately, problems were caused by problems with the post service within London.

## Fast

Are you a winner in the Expanding Fast competition from April 1987? Read on and find out.

## Bug Finder

We'd like to reward our readers who've run a Bug Finder service.

If you have typed in one of our programmes and despite much checking, you still can't get it to run then send us the following:

Two copies of your program on tape or disk.

A description of your problem. If possible a listing of your work (you may omit lines).

A stamped self-addressed envelope for return of the program to you.

Should any of the above be missing

then we will not be able to deal with your query.

We will try to point out where you have made errors and place a corrected copy of the program back on to your tape or disk before we return it to you.

Do not send a program to us as soon as it starts working, please check it several times first.

We do get a large number of queries and so it may take a while for us to deal with yours personally. Note we can only deal with problems relating to programmes published in *Your Commodore*.

# You won't find these programs in the top ten!

These programs have sold thousands of copies. And yet you won't find them in the charts — why?

We produce programming you can really get your teeth into. Programs like **BUSICALC** and **BUSICALC 3** which can be used at home or in the office to do all sorts of calculations, forecasts and budgets.

Programs like **MICRO ASSEMBLER** and the **DDMM** monitor which make it easy to write machine code programs. Programs like **MUSIC MASTER** which turn your computer into a musical instrument. And programs like the **BASIC** compiler which makes ordinary BASIC programs run much much faster.

We have been writing programs for Commodore computers since 1978 and now have hundreds of programs for the PET, VIC20, C64 and C65 (as well as the C16 and Plus4). So why aren't our programs in the charts?

Because our programs aren't one minute wonders — here today and gone tomorrow. Programs we released for the 64 in 1982 are still selling — and even more important, the people who bought them then are still using them.

Software should be an investment not money down the drain. We believe that the more you put into a program, the more you should get out of it, and that's the way it works with software from **SUPERSOFT**.

The programs listed on the right represent a small selection from our range, but you can get a full list if you phone or write to the address below. We offer an excellent mail order service, and you can pay by cheque, Access or Visa.
